ATLANTA, GEORGIA 30309

# NOTICE OF DECISION

Secretary of Labor v. Ford Motor Company

OSHRC Docket No. 81-347

1. Enclosed is a copy of my decision. It will be filed with the Commission on December 7, 1981, and will become the final order of the Commission on January 6, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N. W., Suite 601
   Washington, D. C. 20006

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is January 6, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>FORD MOTOR COMPANY,<br><br>Respondent,<br><br>and<br><br>INTERNATIONAL BROTHERHOOD OF ELECTRICAL WORKERS, LOCAL UNION 1377, AFL-CIO,<br><br>Authorized Employee Representative. | ) | OSHRC Docket No. 81-347 |

APPEARANCES:

Gary A. Boncella, Esquire, Office of the Solicitor, U. S. Department of Labor, Cleveland, Ohio, on behalf of the complainant.

Theodore C. Miloch, Esquire, Ford Motor Company, Dearborn, Michigan, on behalf of the respondent.

Gerald B. Chattman, Esquire, and Nancy Noall, Esquire, Cleveland, Ohio, on behalf of the authorized employee representative.

## DECISION AND ORDER

SPARKS, Judge: An inspection of the Cleveland Casting Plant of Ford Motor Company resulted in a "serious" citation and a proposed $1,000.00 penalty.

An alleged PCB leak at Substation J gave rise to charges that appropriate personal protective equipment was not used and that the procedures for use of respirators did not comply with several OSHA standards.

The International Brotherhood of Electrical Workers, Local Union 1377, AFL-CIO, which represents the affected employees, elected party status.

Prior to the scheduled hearing, attorneys for complainant and respondent submitted a Stipulation and Settlement Agreement which amended the description of the alleged violations, reduced the classification of the violations to "other than serious" and proposed no penalty (Tr. 5).

Respondent agreed to abate the alleged violation by September 1, 1981.

The International Brotherhood of Electrical Workers filed formal objections to the proposed Stipulation and Settlement Agreement on the following grounds:

1. The deletion of sub-paragraphs 1(b) through 1(g) of the citation and the substitution of a new sub-paragraph 1(b) with 1(e) removes several provable alleged violations from the citation. Substation J, where the conditions existed, is a remote work area which, for safety reasons, requires that two electricians be assigned to work in pairs.

2. Considering the dangerous conditions described in the citation, change in classification to "other than serious" and the deletion of the penalty makes a mockery of the intent and spirit of the Act.

3. The PCB spill which led to the issuance of the citation was not an isolated incident as there was another occurrence in less than a year.

4. Members of the union are genuinely concerned about the dangers of PCB, to the extent that several have been disciplined for refusing to work in or around an area after a PCB spill.

A hearing on the objections was held September 9, 1981, at Cleveland, Ohio. Necessary facts were received as profferred evidence (Tr. 7-8).

The employees consistently reiterated that their objections were made in good faith and based solely on the perceived health hazard and are not a bargaining

ploy for other negotiations (Tr. 8–9).

Attorneys for the employees argue that reducing the characterization from "serious" to "other than serious" and deleting the proposed penalties removes the motivation for Ford to fully comply with the standards as it implies the safety problem is a minor one (Tr. 18–19).

The union further contends that compliance with the revised language of the citation may be insufficient to fully protect the health of employees because the wording is so generalized there is no way to determine if the Company has complied with the agreement (Tr. 20–21).

The Review Commission's position concerning settlement agreements is set forth in Rule 100 of the Rules of Procedure, which provides as follows:

> Rule 100 Settlement
>
> (a) Policy. Settlement is permitted at any stage of the proceedings. Settlements submitted to consideration after the Judge's decision has been directed for review shall be filed with the Executive Secretary. A settlement proposal shall be approved when it is consistent with the provisions and objectives of the Act.
>
> (b) Requirements. Every settlement proposal submitted to the Judge or Commission shall include, where applicable, the following:
>
> (1) A motion to amend or withdraw a citation, notification of proposed penalty, notice of contest, or petition for modification of abatement;
>
> (2) A statement that payment of the penalty has been tendered or a statement of a promise to pay; and
>
> (3) A statement that the cited condition has been abated or a statement of the date by which abatement with be accomplished.

The current rule is a revision of the longstanding policy concerning settlements announced in Dawson Brothers, Mechanical Contractors, 72 OSAHRC

The Commission has recently reiterated its policy of encouraging settlement agreements and has approved settlement agreements which contain exculpatory language as being consistent with the intent of the Act and the spirit of the Administrative Procedure Act. Farmers Export Company, 80 OSAHRC 66/A2, 8 BNA OSHC 1655, 1980 CCH OSHD ¶ 24,569 (No. 78-1708, 1980).

Complainant and respondent rely upon recent decisions of the Circuit Courts of Appeal for the Sixth and Third Circuits in asserting that the union lacks standing to oppose the settlement agreement. In Marshall v. OSAHRC (IMC Chemical Group), 635 F.2d 544 (6th Cir. 1980), the court held that the union lacked standing to object to the Secretary's actions in withdrawing a citation. In Marshall v. Sun Petroleum Products Co., 622 F.2d 1176 (3d Cir. 1980), the court held that review of a settlement agreement by the Administrative Law Judge is allowed "only for the limited purpose of entertaining objections from the employees or employees' representative that the abatement period is unreasonable".

The union correctly points out that the Commission has permitted a union that has elected party status to raise objections other than the reasonableness of the abatement period (Brief P. 5). Farmers Export Co., 80 OSAHRC 66/A2, 8 BNA OSHC 1655, 1980 CCH OSHD ¶ 24,569 (No. 78-1708, 1980). In that case, however, Chairman Cleary writing for the Commission, stated as follows:

> "As long as a proposed settlement is consistent with the criteria set out in our decision in Dawson Brothers, Mechanical Contractors, (citation omitted) and Commission Rule 100, particularly as to the abatement of the alleged hazards, the statutory purpose of assuring a safe and healthful workplace is served by a prompt voluntary disposition of a contested case."

The proposed settlement agreement requires that the conditions described in the amended citation be abated by September 1, 1981. The safety and health of employees is not served by prolonging this proceeding. The sooner a final order is entered the sooner compliance may be verified, and if necessary, additional proceedings may be instituted.

Although the Commission respectfully declines to follow all adverse decisions of the circuit courts of appeal, Farmers Export Co., supra, the efficient administration of the Act dictates that due consideration be given to the precedent in the circuit.

In recognition of the holding of the circuit court of appeals and on its own merits as consistent with Rule 100, the settlement agreement is approved.

## CONCLUSIONS OF LAW

1. The Commission has jurisdiction of the parties and the subject matter.

2. The settlement agreement is consistent with Rule 100 of the Commission's Rules of Procedure and the Act.

ORDERED:

The settlement agreement is approved and its terms incorporated herein.

Dated this 7th day of December, 1981.

# NOTICE OF DECISION

Secretary of Labor v. The Cedar Chest, d/b/a Waterbeds Unlimited, Inc.

OSHRC Docket No. 80-6661-B

1. Enclosed is a copy of my decision. It will be filed with the Commission on December 10, 1981, and will become the final order of the Commission on January 11, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

Chief Review Counsel
Occupational Safety and Health Review Commission
1825 K Street, N.W., Suite 601
Washington, D.C.. 20006

Any Petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is January 11, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

For the Respondent:
Stephen A. Welsh, pro se, Colorado Springs, Colorado.

## DECISION AND ORDER

Child, R. M., Judge, OSHRC:

### Statement of the Case

This proceeding is before the Occupational Safety and Health Review Commission (the Commission), pursuant to Section 10(c) of the Occupational Safety and Health Act of 1970, 29 U.S.C. §651 et. seq. (the Act).

By order dated May 19, 1981 Chief Administrative Law Judge Paul A. Tenney dismissed the Notice of Contest filed by the respondent herein to Citations No. 1 and No. 2, issued to the respondent on October 17, 1980, to the extent said notice put in issue the substance of said citations. Judge Tenney's Order reserved for determination the issue of contested penalties only and provided by its terms that

otherwise the said citation had become an order.

Judge Tenney's aforesaid Order became a final Order of the Commission on June 18, 1981.

The matter came on regularly for hearing before the undersigned judge on the issue of appropriateness of the penalties on August 18, 1981. Mr. Steven A. Welsh appeared at that time and indicated on behalf of the respondent that respondent was unable to proceed with the hearing. Mr. Welsh was extended the opportunity of a continuance in order to obtain new counsel or to prepare a defense on behalf of the respondent. He opted to waive a continuance and represented that agreement had been reached with counsel for the complainant to settle the penalties. The hearing on June 18, 1981 was thereupon terminated.

The file discloses that on August 20, 1981 counsel for complainant forwarded settlement documents to the respondent, "Mr. Steve Welsh, President." The file further discloses that by reason of lack of response, a follow-up letter was forwarded to respondent by counsel for complainant on September 14, 1981.

Since formal settlement documents were not filed with the Commission the matter was again noticed "...for hearing on the issues remaining to wit: the contested penalties proposed in the citation."

The matter came on regularly for hearing on said remaining issues at Colorado Springs, Colorado, on October 16, 1981. No one appeared at said hearing on behalf of the respondent. Complainant appeared at said hearing to seek affirmance and assessment of penalties totaling $660.00 for various items set forth in Serious Citation No. 1, aforesaid.

Default of the respondent was duly entered. Complainant moved by reason of said default that respondent's Notice of Contest be dismissed, and the proposed penalties affirmed. Said motion was taken under advisement and the complainant

presented evidence in support of the penalties proposed in said Serious Citation No. 1.

## The Evidence

Mr. Raymond Nellar, compliance officer for the complainant inspected the respondent's worksite at 410 East Fillmore Street, Colorado Springs, Colorado commencing October 2, 1980. In calculating the proposed penalties for each of the violations cited pursuant to that inspection he considered the number of employees exposed, the proximity to the danger, the frequency of the exposure, any stress to which the employees were subjected and other factors such as safety training.

With respect to the violations noted at items 1(a)[1/], 1(b)[2/] and 1(c)[3/] a fire and explosion hazard was presented. He determined that approximately eight employees used the spray booth in a three shift work day and that exposure was

Standard

§1910.107 Spray finishing using flammable and combustible materials.

(e) Flammable and combustible liquids - storage and handling.

(5) Spraying containers. Containers supplying spray nozzles shall be of closed type or provided with metal covers kept closed. Containers not resting on floors shall be on metal supports or suspended by wire cables. Containers supplying spray nozzles by gravity flow shall not exceed 10 gallons capacity. Original shipping containers shall not be subject to air pressure for supplying spray nozzles. Containers under air pressure supplying spray nozzles shall be of limited capacity, not exceeding that necessary for 1 day's operation; shall be designed and approved for such use; shall be provided with a visible pressure gage; and shall be provided with a relief valve set to operate in conformance with requirements of the Code for Unfired Pressure Vessels, Section VIII of the ASME Boiler and Pressure Vessel Code - 1968. Containers under air pressure supplying spray nozzles, air-storage tanks and coolers shall conform to the standards of the Code for Unfired Pressure Vessels, Section VIII of the ASME Boiler and Pressure Vessel Code - 1968 for construction, tests, and maintenance.

injury which would likely be realized in the event of a fire or explosion and the probability thereof were taken into consideration by him in determining the gravity of the violation all of which supported a base penalty of $800.00

Mr. Nellar then discounted the base penalty by 30% due to the size of the respondent's business which was eighteen employees. He also discounted the base penalty by 30% for good faith since Mr. Welsh on behalf of respondent indicated the violations would be corrected. Finally a 10% discount of the base penalty was applied for history since the respondent had not previously been inspected. In this manner a combined penalty of $240.00 was proposed for items 1(a), 1(b) and 1(c).

---

3/ A description of the violation and the standard involved:

Citation

1c 29 C.F.R. 1910.107(g)(2): Spraying area(s) were not kept free from the accumulation of deposits of combustible residues:

(a) In the spray room, the DeVibliss exhaust spray booth.

Standard

§1910.107 Spray finishing using flammable and combustible materials.

(g) Operations and maintenance.

(2) Cleaning. All spraying areas shall be kept as free from the accumulation of deposits of combustible residues as practical, with cleaning conducted daily if necessary. Scrapers, spuds, or other tools used for cleaning purposes shall be of nonsparking material.

With respect to the violations noted at item 2 of said Serious Citation No. 1,[4/] Mr. Nellar testified that these electrical violations occurred in the vicinity of the paint spraying booth and presented a hazard of igniting vapors in the area. The factors in determining gravity of the violation and reduction for size,

3e 29 C.F.R. 1910.213(m)(1): Cutting heads of wood shaper(s) were not enclosed with a cage or adjustable guard so designed so as to keep the operator's hand away from the cutting edge:

(a) In the Shaping Area, the Rockwell wood shaper motor model #1225304.

Standard

§1910.213 Woodworking machinery requirements

(m) Wood shapers and similar equipment.

(1) The cutting heads of each wood shaper, hand-fed panel raiser, or other similar machine not automatically fed, shall be enclosed with a cage or adjustable guard so designed as to keep the operator's hand away from the cutting edge. The diameter of circular shaper guards shall be not less than the greatest diameter of the cutter...

serious cuts or fractures or possibly amputations of the fingers and parts of the hand. Again Mr. Nellar received assurance from Mr. Welsh that the violations would be corrected. Upon consideration of those factors of gravity and discount which applied to the other violations the complainant proposed a total penalty or $180.00 for items 3(a), 3(b), 3(c), 3(d) and 3(e).

Discussion

Rule 62(a) of the Rules of Procedure of the Commission provides that a non-appearing party at a hearing shall retain the right "...to be served with a copy of the decision of the judge..."

Rule 90 of said Rules provides in part that when a hearing is held the decision shall comply with 5 U.S.C. §557.

5 U.S.C. §557 provides in pertinent part:

> "...All decisions...shall include a statement of -
>
> (A) Findings and conclusions, and the reasons or basis therefor, on all the material issues of fact, law or discretion presented on the record; and
>
> (B) The appropriate rule, order, sanction, relief, or denial thereof."

Consistent with the foregoing provisions the motion of the complainant to dismiss respondent's notice of contest is denied.

---

The penalty proposed by the Secretary of Labor through his area directors is assessed only if not contested; otherwise the Review Commission can affirm the penalty as proposed, modify it or vacate it. Long Manufacturing Co. v. OSHRC, 554 F.2d 903 (8th Cir. 1977); California Stevedore and Ballast Co. v. OSHRC, 517 F.2d 986 (9th Cir. 1975). The determination of an appropriate penalty is within the discretion of the Review Commission. Western Waterproofing Co. v. Marshall, 576 F.2d 139 (8th Cir. 1978).

In assessing penalties for violations of the Act, the Commission must consider the size of the business of the cited employer, the gravity of the violation, the employers good faith or absence of it and the history, if any, of previous violations. 29 U.S.C. §666(i).

Evidence bearing on said factors was presented by the complainant through the testimony of the compliance officer. Such evidence was sufficient to support the appropriateness of the penalties as proposed.

---

Based upon the foregoing factors and the evidence there are hereby entered the following:

## Findings of Fact

1. The sum of $240.00 is an appropriate penalty for the violations set forth at items 1(a), 1(b) and 1(c) of Serious Citation No. 1, issued to respondent October 17, 1980.

2. The sum of $240.00 is an appropriate penalty for the violation set forth at item 2 of said Serious Citation No. 1.

3. The sum of $180.00 is an appropriate penalty for the violations set forth at items 3(a), 3(b), 3(c), 3(d) and 3(e) of said Serious Citation No. 1.

## Conclusions of Law

1. The Commission has jurisdiction of the parties and of the subject matter herein.

## ORDER

Respondent is ASSESSED a total combined penalty of $660.00.

Christina Gallop, Secretary-Treasurer, of Kingston, N.Y., for Respondent, pro se.

JAMES P. O'CONNELL, JUDGE

STATEMENT OF THE CASE

This is a proceeding pursuant to section 10 of the Act[1/] contesting a citation issued to Respondent (J&G) under section 9(a).

The citation alleges that as a result of an OSHA inspection made on October 21-23, 1980, of a workplace located on Sterling Mine Road, Sterling Forest, New York, Respondent violated a construction standard. The citation for serious violation and the notification of proposed penalty were issued

1/ Occupational Safety and Health Act of 1970 (20 U.S.C. § 651 et seq.)

on October 30, 1980. Respondent timely filed a general notice of contest.

The standard,[2/] general allegations, and proposed penalty involved in this contest are as follows:

Citation No. 1 - Serious

| ITEM | STANDARD | DESCRIPTION | PENALTY |
|---|---|---|---|
| 1 | 29 CFR 1926.400(h)(1) | Approved ground-fault circuit interruptor(s) or an assured equipment grounding conductor program was not used for the protection of employees using 120 volt, single phase, 15 and 20 ampere receptacle outlets that were not a part of the permanent wiring of a building or structure: | $ 400.00 |

Temporary Loading Dock at South side of IBM Complex. Carpenters utilizing cord & plug connected Skill hammer drill & two (2) $7^1/_4$" Black & Decker saws.

---

2/ The standard provides:

§ 1926.400 - General Requirements (Electrical)

(h) Ground-fault protection.

(1) General. Notwithstanding any other provision of this part, the requirement in section 210-7 of the 1971 National Electrical Code (NFPA 70-1971; ANSI C1-1971) that all 15- and 20-ampere receptacle outlets on single-phase circuits for construction sites have approved ground-fault circuit protection for personnel does not apply. In lieu thereof, the employer shall use either ground-fault circuit interrupters as specified in paragraph (h)(2) of this section or an assured equipment grounding conductor program as specified in paragraph (h)(3) of this section, to protect employees on construction sites. These requirements are in addition to any other requirements for equipment grounding conductors.

A hearing on the merits was held at Poughkeepsie, New York on April 22, 1981. Complainant's case consisted of the testimony of David Scott, an OSHA compliance officer, and one (1) photographic exhibit depicting the ground-fault circuit interrupter (G.F.C.I.) in use on the job site (Exh. C-1). Respondent's case was the testimony of its project superintendent, Conrad Moore. No employee or employee representative was a party (Tr. 4). Complainant filed a post-hearing brief and Respondent filed a post-hearing reply brief.

## JURISDICTION AND ISSUES

Jurisdiction is conceded (Tr. 5). The issues for determination are (1) whether Respondent violated the cited standard, and if so, (2) what civil penalty is appropriate therefor.

## FINDINGS OF FACT

I make the following findings:

1. On October 21-23, 1980, Respondent was engaged as a Drywall subcontractor on a project located at the IBM Complex in Sterling Forest, New York, where a large addition was under construction. On the south side of the complex, J&G had four carpenters assemblying an outside temporary loading dock. It had been on the job site for about a week.

---

2/ § 1926.400 - General Requirements (Electrical) cont'd...

(2) Ground-fault circuit interrupters. All 120-volt, single-phase, 15- and 20-ampere receptacle outlets on construction sites, which are not a part of the permanent wiring of the building or structure and which are in use by employees, shall have approved ground-fault circuit interrupters for personnel protection.

2. On October 22, 1980, at about 2:15 p.m., an OSHA inspection at the above workplace was conducted by Compliance Officer (C.O.) David Scott. Sunny and dry weather conditions existed at the time.

3. The C.O. observed J&G employees using several hand-held electrical tools such as a Skill hammer and saws. The Skill saws, each containing a three-pronged plug, when in use were plugged into two Underwriters Laboratories (UL) approved fifty foot extension cords, which lead to and were plugged into a G.F.C.I., from which another UL approved fifty foot extension cord extended to and was plugged into the permanent wall outlet or permanent wiring of the building (Tr. 13, 28-32, Exh. C-1). This entire system or arrangement, and each of its parts, was properly grounded (Tr. 24,30,32,49). The electrical tools were examined and found to be in good working condition (Tr. 34-35). Extension cords are considered to be temporary wiring (Tr. 10,19,21).

4. The C.O., upon testing the portable G.F.C.I. unit, found that it was not working properly (Tr. 9-10). When and why it became inoperable is not known (Tr. 20,47). After a certain amount of time in use, the unit does build up a carbon deposit and does not work (Tr. 21). The hazard existing at the time of the inspection was non-obvious and detectable only through the use of a testing device.

5. Respondent had obtained the G.F.C.I. unit from the electrical contractor on the job site (Tr. 18,47). There is no evidence of record that the unit was not in proper working order when first installed on the workplace (Tr. 23). There is no evidence of record that Respondent knew of the violative condition prior to or at the time of the OSHA inspection.

6. The standard at issue makes no reference to any duty upon an employer to periodically test the G.F.C.I. unit.

7. Upon being advised by the C.O. that the G.F.C.I. unit was not working properly, Respondent's foreman stopped his men from using the electrical saws and obtained a new unit from the electrician on the job site. The next day, October 23, 1980, the C.O. checked this new unit and found it working properly (Tr. 16,35).

8. J&G have no history of any OSHA violations. It was most cooperative with the C.O. during his inspection, and exhibited considerable good faith in having a G.F.C.I. unit on the temporary wiring in use at the time and by immediately correcting the hazard when it knew of its existence (Tr. 20).

9. The Secretary has failed to sustain his burden of proof by the required preponderance of the credible evidence that Respondent was in violation of 29 CFR 1926.400(h)(1) on October 22, 1980.

OPINION

The Secretary has the burden of proving all necessary elements of a violation under the Act.29 CFR 2200.73(a); 5 U.S.C. 556(d). He has the burden to prove that Respondent violated the cited standard, that its employees were exposed or had access to the violative condition, and that the employer had either actual or constructive knowledge of the violative condition. The Act does not impose strict liability. The proof must be clear and convincing. It cannot be presumed or inferred. Ellison Electric, 1 OSAHRC 547, 1 BNA OSHC 3034, CCH OSHD para. 15,133 (No. 412, 1972); Edison Lamp Works, No. 76-484, 1979. The preponderance of the evidence rule is required to establish a job safety violation in these proceedings. Armor Elevator Company, Inc., 5 OSAHRC 260, 1 BNA OSHC 1409, CCH OSHD para. 16,958 (Nos. 425 & 426, 1973).

An employer lacking either actual or constructive knowledge of a condition which contravenes a standard cannot be expected to prevent that condition, and therefore has not violated the standard. Green Const. Co. & Massman Const. Co., 4 BNA OSHC 1808, CCH OSHD para. 21,235 (No. 5356, 1976). Failure to prove that the employer had knowledge of the existence of the violation at the time of the alleged violation, warrants a finding that the Secretary has failed to sustain his burden of proof. Such is the circumstance in this proceeding.

I cannot presume that if J&G had tested the G.F.C.I. on the morning of the inspection, the unit would have been found to be inoperable. Neither may I infer from the evidence of record that the unit which Respondent had installed in compliance with the standard, had ceased to function some time prior to the C.O. finding that it was not working properly. It could very well have become inoperable five minutes before the C.O. tested the unit. The Act does not require an employer to take steps to search for a non-obvious electrical hazard every time a hand tool is used by its employees. The Review Commission has held that an employer cannot be held responsible for a non-obvious electrical hazard whose existence was unknown. See 4 G Plumbing & Heating, Inc., 6 BNA OSHC 1528, CCH OSHD para. 22,658 (No. 12892, 1978). In New England Tel. & Tel. Company v. Secretary of Labor & OSAHRC, 589 F. 2nd 81 (1st Cir., 1978), the Court commented:

> If a passageway is properly lighted, a subcontractor does not have to stand around and see that the bulb does not burn out.

Paraphrasing the above, if a temporary wiring system is properly grounded and a ground-fault interrupter unit installed, a subcontractor supplying such protection does not have to stand around and see that the unit does not become inoperable.

Accordingly, based upon the evidence of record in this proceeding, I am convinced that J&G had no knowledge that the G.F.C.I. unit it had installed on the temporary wiring system had become inoperable prior to the moment the C.O. made his test during the inspection. The citation for serious violation must be vacated.

ARGUENDO

Assuming that there was a violation of the cited standard as alleged by Complainant, in that event, it is my firm opinion that there is insufficient proof of record to support a finding that the violation was of such gravity so as to cause serious injury or death to any worker. The tools and wiring were in good condition. The entire system was properly grounded, and the voltage being used was of such limited quantity, that I doubt if any worker sustaining an electrical shock would sustain such an injury to warrant the classification of a serious violation. Accordingly, I would find any violation to be nonserious. No penalty would be assessed by virtue of Respondent's good faith and the factual findings made herein.

CONCLUSIONS OF LAW

1. Respondent, at all pertinent times, was an employer engaged in a business affecting commerce within the meaning of section 3(5) of the Act. It was subject to the requirements of the Act, including section 5(a)(2), and

the occupational safety and health standards promulgated thereunder. The Occupational Safety and Health Review Commission has jurisdiction of the parties and subject matter herein.

2. Respondent was not in serious violation of 29 CFR § 1926.400(h)(1) as alleged in the citation issued herein, and, such citation and the penalty of $400.00 proposed therefor should be vacated.

O R D E R

Based on the foregoing Findings of Fact and Conclusions of Law, and upon the entire record of this proceeding, it is ORDERED that Citation No. 1, charging a serious violation of 29 CFR 1926.400(h)(1), is vacated. The proposed penalty of $400.00 is also vacated.

# NOTICE OF DECISION

Secretary v. Palmer Instruments, Inc.

OSHRC Docket No. 81-407

1. Enclosed is a copy of my decision. It will be filed with the Commission on December 10, 1981, and will become the final order of the Commission on January 11, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N. W., Suite 601
   Washington, D. C. 20006

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is January 11, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

| Respondent. | ) | |

APPEARANCES:

Bruce C. Heslop, Esquire, U. S. Department of Labor, Cleveland, Ohio, on behalf of complainant.

Jagdish Patel, Esquire, Palmer Instruments, Inc., Cincinnati, Ohio, on behalf of respondent.

## DECISION AND ORDER

This is a proceeding pursuant to Section 10 of the Occupational Safety and Health Act of 1970 (29 U.S.C. § 651, et seq., 84 Stat. 1590, hereinafter referred to as the Act), contesting a citation issued by the complainant against the respondent under the authority vested in complainant by Section 9(a) of the Act.

The citations alleged that as a result of the inspection of a workplace under the ownership, operation and control of the respondent located at Cincinnati, Ohio, the respondent has been charged with violating Section 5(a)(2) of the Act by failure to comply with certain Occupational Safety and Health standards.

A hearing was held in Cincinnati, Ohio, on September 9, 1981. Both parties appeared and presented evidence. There was no motion to intervene.

## ISSUES IN THE CASE

It was alleged that respondent committed a serious violation of Standard 29 C.F.R. § 1910.1001(j)(2) in that a comprehensive medical examination was not provided to employees in the assembly department who wrapped asbestos around thermometer tubes within 30 days after it was determined that the employees were exposed to airborn levels of asbestos.

At the beginning of the hearing, the parties stated upon the record that a compromise agreement had been entered into as to this alleged violation. It was agreed that the citation would be affirmed with the proposed penalty reduced to $180. It was stated that the respondent represents it has abated the violation and that the respondent withdraws its notice of contest to said citation and to the penalty as amended. Said settlement agreement as to said standard is hereby approved.

It was further alleged that the respondent was in repeat violation of Standard 29 C.F.R. § 1910.134(b)(11) in that approved or accepted respirators were not used when they were available. It was alleged that on October 23, 1980, the employee who worked in the pump room and assembly area and was exposed to mercury vapor concentrations in excess of the eight-hour permissible exposure limit wore a Pulanosan air purifying respirator at times and a 3M Section 8707 respirator at other times. It was alleged that neither of these respirators is approved for use in mercury vapor and air atmospheres above the permissible limit due to the poor warning properties of mercury vapor.

It was further alleged that respondent was in repeat violation of Standard 29 C.F.R. § 1910.1001(b)(1) in that employees were exposed to materials in excess of

the eight-hour time weighted average limits listed by the particular materials in Table Z-2 of Subpart Z of 29 C.F.R., Part 1910. It was alleged that on October 23, 1980, an employee worked four hours in the pump room and four hours in the assembly area and was exposed during a 453 minute survey to a time weighted average concentration of 0.146 $mg/m^3$ of mercury and air which is 1.46 times the eight-hour permissible exposure limit.

It was further alleged that respondent was in repeat violation of Standard 29 C.F.R. § 1910.1000(e) in that feasible administrative or engineering controls were not determined and implemented to reduce employee exposure. It was alleged that on October 23, 1980, an employee who worked four hours in the pump room filling, pressurizing and sealing the thermometers and four hours in the assembly area assembling thermometers was exposed over a full shift to airborn concentrations of mercury vapor 1.46 times the eight-hour permissible exposure limit and adequate, feasible, administrative or engineering controls were not determined and employed to reduce these levels.

## EVIDENCE AND EVALUATION OF THE CASE

This judge can only consider the evidence introduced at the hearing. No exhibits presented post hearing, and no statements of fact in briefs not appearing in the evidence introduced at the hearing can be considered.

It is undisputed that prior citations alleging violations of Standards 29 C.F.R. § 1910.134(b)(11), 29 C.F.R. § 1910.1000(b)(1) and 29 C.F.R. § 1910.1000(e) had become final orders sustaining such citations.

There is considerable dispute in the record as to whether an employee of the respondent was exposed to mercury fumes which were in excess of those permitted

by the standard. The complainant took exposure to mercury measurements by a solid state sensor mercury monitor or badge attached to the employee's breathing zone (Tr. 13). The badge consisted of a plastic holder with an opening which contained the mercury sensing device (Tr. 68). Two badges were used to monitor said employee, Mr. Lee, as to his mercury exposure on October 23, 1980 (Tr. 16). Basic sampling data, including sample identification numbers and sampling time, were recorded by Mr. Ellwood, a compliance officer of the complainant (Tr. 13-15, Ex. C-1). The first sample was taken over a period of 223 minutes in the morning and the second sample over 230 minutes in the afternoon (Tr. 17, Ex. C-1). On completion of each sample, Mr. Ellwood removed the badge and placed it in a plastic bag which was placed in a metal cannister which was taped shut and identified with a seal reflecting the date of sampling, sample number and Mr. Ellwood's signature (Tr. 18, 19). Samples were sent to the Occupational Safety and Health Administration in Salt Lake City, Utah, which forwarded them to the supplier of the badges, Advance Chemical Sensors Company, at Pompano Beach, Florida, for analysis.

Dr. Lawrence S. Locker testified for the complainant as to analysis of the sample. Dr. Locker holds a Ph.D. degree in metallurgy and a Masters degree in Chemical Engineering from the Massachusetts Institute of Technology as well as a Bachelor of Chemical Engineering Degree from Syracuse University (Tr. 86, 87). Dr. Locker is the sole proprietor of Advance Chemical Sensors Company which develops, manufactures and sells devices for monitoring personal exposure to toxic vapors (Tr. 87). He personally developed the solid state sensor mercury monitor used by Mr. Ellwood to take the samples (Tr. 87, 88).

Dr. Locker examined the metal cannisters upon them being sent to him from the Salt Lake City laboratory. He calculated the time weighted average concentration of mercury for each of the three samples submitted. (Tr. 92, 95, Ex. C-4). Dr. Locker reported the results of his analysis to the Salt Lake City laboratory (Tr. 95, Ex. C-2). Based upon the sample results and calculation, it was determined that Mr. Lee was exposed to mercury at an eight-hour time weighted average limit of 0.146 $mg/m^3$ (Tr. 23).

The complainant's testing of a mercury sniffer, however, revealed quite different results. The results with the mercury sniffer were as follows:

| Date | Max. | Min. |
|---|---|---|
| 10/22/80 | .038 | .0157 |
| 10/23/80 | .055 | .0447 |
| 10/22/80 | .04 | .038 |

It was testified, however, that the sniffer is a hand-held direct readout device used to detect and measure spot concentrations over a short period of time, usually 15 seconds (Tr. 69, 84). The sniffer is generally used by the complainant as a screening device or spotcheck to detect areas in which there are high levels of mercury and to determine whether pull shift monitoring is warranted (Tr. 58, 59, 69). It was stated that the sniffer was used to take random readings, not necessarily of the employee's reading zone exposure, to determine which employee should be monitored for full shift, and as a check on the badge monitoring to determine if any gross disparity existed (Tr. 11, 12, 70, 72). On the other hand, the badge was designed to be attached to an employee in his breathing zone to continuously monitor his exposure to mercury over a long period of time such as a full work shift or a substantial portion thereof (Tr. 70).

Complainant's witness, Mr. Ellwood, acknowledged on cross-examination that in taking the test, it was possible his hands could have been contaminated with mercury. It was testified, however, that the monitor badge is in an exterior plastic holder with an opening that contains the mercury sensing device. Mr. Ellwood testified that he touched only the exterior plastic holder and not the sensing device (Tr. 68). Dr. Locker visibly examined each badge and observed no evidence of contamination. He testified that if contamination had occurred by placement of a drop of mercury directly on the senor, analysis would reveal an extremely high concentration of mercury indicative of contamination (Tr. 79). Mr. Ellwood prepared during his inspection a blank sample badge taken from the same lot as those used to sample the employees. Analysis of the blank sample revealed a mercury concentration of only 0.004 $mg/m^3$ (Tr. 17, 18, Ex. C-2). Dr. Locker testified that this amount was insignificant and indicated no contamination prior to sampling.

On the other hand, the test taken by the respondent revealed the respondent to be in compliance with the standard. An exhibit reflecting the inspection of the State of Ohio also showed the respondent to be in compliance (Ex. R-7). Exhibits R--8, 9 and 10 show the results of 3M mercury monitor sampling performed by respondent two to five months after inspection. Exhibit R-13 is a series of reports reflecting results of sniffer samples taken during a period from September 11, 1972 to December 3, 1973. Exhibit R-13 contains results of employee urine mercury levels determined during the period from August 1, 1968 to February, 1981. Test were also taken two or three months after complainant's inspection which test reflected compliance with the standard.

It would appear that the method of testing used by the complainant is more reliable than that used by the respondent and therefore, the findings of the complainant on the dates of the inspection in October, 1980, are credited. It is entirely possible, however, that the test taken by both of the respective parties could have been accurate at the time that they were taken notwithstanding the substantial difference in the results of the test. There does not appear to have been a substantial change in the method of operation by the respondent between October 22 and 23, 1980, and the dates of the test made by the respondent two or three months later. A factor, however, that could cause a substantial difference in the mercury vapors to which the employees were exposed is the variability insofar as housekeeping is concerned. The compliance officer of the complainant testified that there were droplets of mercury on the floor and the work table where the employee worked. There was a pool of mercury five inches in diameter under one of the work tables on top of a pump (Tr. 12). This testimony was in no way disputed. The mercury was there, according to said witness, for the entire morning (Tr. 12).

The testimony of the respondent as to housekeeping was as follows:

> "Answer. We have a policy that we have it cleaned every two weeks. Now, there may have been a cleaning of that particular room before my sample or after my sample. Question. So you can't tell me whether the conditions were comparable since they were after the date? Answer. Not as far as housekeeping, no. But as far as the units, the same units being in the room, the installation of the exhaust and all that was the same" (Tr. 135).

It will be seen from the above testimony that the condition due to housekeeping was variable. It is hardly likely that at all times there was a pool of mercury five inches in diameter. Such an exposure to mercury could very well have caused considerable variation in the testing taken.

As above noted, the respondent did engage in testing and the results of the testing indicated compliance with the standard. The Review Commission, in the case of General Electric Company, ____ OSAHRC ____, 9 BNA OSHC 1722, 1981 CCH OSHD ¶ 25,345 (No. 13732, 1976-77), held as follows:

> "When the Secretary alleges that the contaminant is present in excessive amounts but the employer shows that it had made measurements and determined that the concentration was not excessive, the burden is on the Secretary to show that the employer's failure to discover the excessive concentration resulted from a failure to exercise reasonable diligence."

To the same effect, see North American Rockwell Corp., 75 OSAHRC 43/A6, 2 BNA OSHC 1710, 1974-75 CCH OSHD ¶ 19,464 (Nos. 2692 & 2875, 1975), aff'd sub nom., Dunlop v. Rockwell International, 540 F.2d 1283 (6th Cir. 1976).

The question therefore arises as to whether the respondent, having taken tests which revealed respondent to be in compliance, had exercised such diligence as to require a finding that the respondent had done all that could be reasonably expected.

It will be noted that in the above quotation, it is stated ". . . the burden is on the Secretary to show the employer's failure to discover the excessive concentrations resulted from a failure to exercise reasonable diligence." It appears that in the case at bar, this obligation of the Secretary has been met. As above stated, the evidence establishes that the employee was exposed to spilled mercury, both on the table and on the floor, and that one puddle on the floor was five inches in diameter. A five-inch puddle of mercury is a substantial amount and could well have exposed the employee to dangerous amounts of vapor. The uncontradicted evidence is that the mercury remained so exposed the entire morning of the inspection. Had the spillage only been for a few minutes, it might well be argued

that the respondent did not have adequate opportunity to ascertain such condition and, therefore, should not be held responsible. The exposure of an employee to mercury, however, is of sufficient danger to require the respondent not to permit such a condition to exist for an entire morning. There was adequate opportunity for the respondent to have ascertained the condition and more promptly corrected it. The evidence also establishes that the area was cleaned up only once every two weeks. With the amount of spillage established in the evidence, cleaning up the area once every two weeks was totally inadequate. Therefore, notwithstanding the test made by the respondent, the Secretary has established that the respondent's failure to discover the excessive concentrations resulted from a failure to exercise reasonable diligence. The allegations of violation, therefore, have been sustained.

It is undisputed that the respondent had previously been found to be in violation of the standard in that the respondent had excessive mercury vapor. The violation must therefore be held to be a repeat violation.

The complainant established that further efforts at abatement would be successful. It was recommended that local exhaust be installed at the filling location, similar to those installed where the tubes were sealed (Tr. 32). Mercury could be prevented from spilling out on the table or the floor by redesigning the fill system or installing some method of capturing the mercury as, for example, having the mercury fall into water or into some kind of trap where it would not become a vapor. It was also suggested that the spill be immediately cleaned up (Tr. 32). The opinion was expressed that better housekeeping would reduce the exposure to the permissible limit (Tr. 33). It certainly would appear that any spill of mercury should be immediately reported and cleaned up rather than for the cleanup to occur only once every two weeks.

In determining whether the proposed penalty should be assessed, it is necessary to examine the evidences of good faith on the part of the respondent. Subsequent to the finding of prior violation, the respondent did make substantial efforts to improve the situation. General exhaust ventilation was installed and air was pulled out of the room with a fan. There were also two local exhaust systems at one of the tables (Tr. 31). There was, however, no local exhaust system at the location where Mr. Lee filled the tubes with mercury (Tr. 31). There were local exhausts where the tubes were sealed (Tr. 32). The respondent also took substantial tests (Tr. 114-118, 121, 122, 125, 126, 134, 135). This included urinary sample and mercury analysis samples. The mercury analysis samples, however, were not taken on or about the time of the inspection by the complainant. It appears that the respondent did make an earnest effort to remedy the situation and that the respondent made substantial effort to monitor the situation to see whether or not the problem continued. The respondent did not go far enough in that the housekeeping was inadequate, but in view of the evidence of good faith and the substantial efforts made by the respondent, a penalty in the amount suggested would not be proper. A penalty in the amount of $200 will, therefore, be assessed.

It was also alleged that inadequate respirators were used. Standard 29 C.F.R. § 1910.134(b)(11) in pertinent part, reads as follows:

> "Approved or accepted respirators shall be used when they are available. The respirator furnished shall provide adequate respiratory protection against the particular hazard for which it is designed in accordance with standards established by competent authorities. The U. S. Department of Interior, Bureau of Mines, and the U. S. Department of Agriculture are recognized as such authorities."

The testimony of the complainant's compliance officer was to the effect that the respirators used by Mr. Lee were negative pressure respirators, that is, a

person breathes in, the air is pulled through the filtering device, and when exhaled, it goes through an exhalation device (Tr. 26). He wore a Pulmosan air purifying respirator in the pump room and a 3M 8707 respirator in the assembly room. The 3M 8707 respirator is made of paper material, and fits over the nose and mouth and is held on with two straps that go around the head. It is designed to be disposable. It was testified that documents showing approved respirators do not reflect these respirators as approved. It is further stated that there is no negative pressure respirator approved by NIOSH (Tr. 27, 28).

It was testified that the respirator is not adequate in that there is no odor provided whereby the wearer can know if he is being affected by mercury vapors. Mercury has no odor and no irritating effect. Therefore, if the respirator is not functioning properly, he would not have any indication that the respirator was defective (Tr. 28, 29). If the employee did not get a proper fit, he could be working in a huge concentration of mercury and not be able to detect it through an odor or irritation (Tr. 29). According to complainant's testimony, a continuous flow airline or a pressure demand respirator would be proper. These respirators are known as positive pressure respirators (Tr. 29).

Respondent's Exhibit 12, which is product literature of the 3M Company from whom the mask used by respondent was purchased, contains the following statement:

> "The 8707 is not NIOSH approved since present NIOSH test schedules do not cover mercury vapor. However, when used in accordance with OSHA program directive, Section 300-9 Glg, the product is considered 'accepted' respiratory protection."

It will be observed that both the testimony that the respirator had not been approved by NIOSH and the evidence that NIOSH does not test for mercury vapors

but has accepted the type of respirator used by respondent is completely hearsay evidence.

The complainant, however, attached to its post hearing brief pages from its manual listing the approved respirators. The respirators here involved do not appear in the list. Even aside from the question of whether judicial notice may be taken of such attachment, the uncontradicted hearsay statements of the compliance officer make out a prima facie case as to lack of approval by NIOSH. The uncontradicted hearsay evidence of respondent that NIOSH does not test for mercury vapor similarly makes out a prima facie case for the truth of that statement. The Review Commission has on several occasions held, that hearsay evidence must be received in an administrative proceeding. In the case of Metro-Mechanical, Inc., ____ OSAHRC ____, 3 BNA OSHC 1350, 7475 CCH OSHD ¶ 18,795 (No. 3518, 1975), the Review Commission stated:

> "The Commission has held that it will not allow a citation to stand solely on the basis of hearsay evidence where such evidence is contradicted. Millprint, Inc., No. 513 (Oct. 18, 1973). Such is not the case here. The compliance officer's testimony that the workman seen on the scaffold was an employee of respondent, while hearsay evidence, remains uncontradicted and thus, is an acceptable basis for which to find respondent in violation of Section 5(a)(2) of the Act."

This judge therefore finds that such evidence is competent and being uncontradicted by the opposite party in each instance must be credited. It therefore is held that the respirator used by the respondent has not been approved by NIOSH but that NIOSH does not test for mercury vapors.

In the respondent's brief, it is pointed out that Industrial Hygiene Field Operations Manual issued on June 9, 1977, provided that unapproved respirators could be used only if MESA-NIOSH does not have a test schedule for the specific air contaminant. The section further provided that the employer must justify the

intended purpose of such devices and demonstrate that the respirator can provide the protection required and that if OSHA concurs, the respirator is considered accepted. The brief further points out that in January, 1980, a revised manual was published which does not contain the foregoing provision relating to respiratory program acceptability.

Irrespective of whether the current manual provides for a means whereby a respirator can be "accepted" even though there is no test schedule for the specific air contaminant, it is difficult to see how the respondent could be found to be in violation because a respirator was used which had not been approved by NIOSH when NIOSH does not approve any respirators relating to exposure for mercury vapors. Therefore, under the evidence submitted in this case, a violation of Standard 29 C.F.R. § 1910.134(b)(11) has not been established.

Standard 29 C.F.R. § 1910.134(a)(2) which was not alleged in the citation, was as follows:

> "Respirators shall be provided by the employer when such equipment is necessary to protect the health of the employees. The employer shall provide the respirators which are applicable and suitable for the purpose intended. The employer shall be responsible for the establishment and maintenance of a respiratory program which shall include the requirements outlined in paragraph (b) of this section."

It will be noted that the above quotation includes the following: "The employer shall provide the respirators which are applicable and suitable for the purpose intended." As above observed, the testimony of the compliance officer was to the effect that the respirator was inadequate since it did not make allowance for the fact that there was no way from either smell or irritation that an employee could ascertain that he was being poisoned by mercury vapors. This evidence was not objected to. The citation includes the statement: "Neither of these respirators

are approved for the use in mercury vapor in air atmospheres above the permissible limit due to the poor warning properties of mercury vapor." It was therefore alleged that the respondent's employee was possibly exposed to mercury vapors due to the poor warning properties of mercury vapor. If the respirator was defective, in that it inadequately protected the employee, it could not be said that it was "suitable for the purpose intended." The respondent was put on notice by the citation that the suitability of the respirator was in question and that this was because of the lack of warning to an employee wearing such respirator in the event that the respirator might either be defective or improperly fitted.

The issue of suitability of the respirator was fully tried. As above stated, there was no objection to any of the testimony of the complainant with reference to the defects in the respirator.

The Review Commission has, on several occasions, held that in the event a respondent is on notice of the issue which is tried and if the issue is fully tried without objection, the pleadings should be amended even subsequent to the conclusion of the hearing so as to conform the pleadings to the proof. In view of this precedent, the citation is hereby amended so as to incorporate Standard 29 C.F.R. § 1910.134(a)(2). A violation of this section must therefore be found.

The respondent relied upon the above quoted statement found in the pamphlet of the manufacturer from whom the respirator was purchased. In the respirators which were supplied, the respondent, therefore, acted in utmost good faith. It does not appear that in view of the good faith actions of the respondent in this regard, a penalty above the minimum required should be assessed. This is a repeat violation, a previous violation having been found; but it occurred, not because of a defiance of the law, but because of a honest belief of the respondent that the respondent was in compliance.

A penalty in the amount of $1.00 is therefore assessed for this violation.

## FINDINGS OF FACT

1. The respondent purchased and acquired materials from beyond the State of Ohio.

2. An employee of respondent was, at times between October 23, 1980, and January 6, 1981, while working in the pump room and assembly area, exposed to a time weighted concentration of mercury vapor of 0.146 $mg/m^3$.

3. On or about October 23, 1980, said employee was exposed to mercury vapors as a result of mercury being spilled on and below a table near which the employee was working.

4. The respondent only cleaned up said area once every two weeks.

5. The methods of abatement proposed by complainant are feasible and would reduce the concentration of mercury vapor.

6. On or about October 23, 1980, said employee who worked in the pump room and assembly area while exposed to mercury vapor concentrations in excess of the eight-hour exposure limit, wore a Pulason air purifying respirator part of the time and a 3M 8707 respirator at other times.

7. Neither of these respirators was approved for use in mercury vapor in air atmospheres above the permissible limit but NIOSH did not test respirators and their adequacy in reference to mercury vapors.

8. Said respirators were negative respirators and inadequate protection to the employees because they did not adequately compensate for the fact that mercury vapors are not always detectible either from smell or irritation and the employees might not be aware of possible defective equipment or improper fit.

## CONCLUSIONS OF LAW

1. Respondent is engaged in a business affecting interstate commerce and is within the jurisdiction of the Occupational Safety and Health Act.

2. Respondent was at various times between October 23, 1980, and January 6, 1981, in violation of Standard 29 C.F.R. § 1910.1001(j)(2).

3. Respondent was, on or about said dates, in violation of Standard 29 C.F.R. § 1910.1000(b)(1).

4. Respondent was, on or about said dates, in violation of Standard 29 C.F.R. § 1910.1000(e).

5. Respondent was not, on or about said dates in violation of Standard 29 C.F.R. § 1910.134(b)(11).

6. Respondent was on said dates in violation of Standard 29 C.F.R. § 1910.134(b)(2).

## ORDER

The settlement agreement of the parties settling the alleged violations of Standard 29 C.F.R. § 1910.1001(j)(2) is approved.

In view of said settlement agreement, the penalty is reduced to $180 and the allegations in the citation in reference to said standard as well as the notification of proposed penalty as amended, are as to said standard affirmed.

Respondent was, on or about said dates, in violation of Standards 29 C.F.R. § 1910.1000(b)(1) and 29 C.F.R. § 1910.1000(e). Said standards shall be abated within 30 days of this decision becoming a final order. A penalty in the amount of $200 is assessed for said violations.

Respondent was not at anytime relevant to the cause in violation of Standard 29 C.F.R. § 1910.134(b)(11).

The citation and complaint are amended to incorporate an alleged violation of Standard 29 C.F.R. 1910.134(b)(2).

Respondent was on said dates in violation of Standard 29 C.F.R. § 1910.134(b)(2). Said violation shall be abated within 30 days of this decision becoming a final order. A penalty in the amount of $1.00 is assessed for this violation.

Dated this 10th day of December, 1981.

JOHN S. PATTON
Judge

# OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

1515 Broadway, Room 3800
New York, New York 10036

## NOTICE OF DECISION

Secretary of Labor v. CERRITO ELECTRIC CONTRACTOR CORP.
OSHRC Docket No. 81-1227

1. Enclosed is a copy of my decision. It will be filed with the Commission on December 14, 1981, and will become the final order of the Commission on January 13, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is January 13, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

for the Respondent

## DECISION AND ORDER

Ditore, J.

## PRELIMINARY STATEMENT

Respondent contested a citation for serious violations of 29 CFR §§ 1926.401(a)(1), 1926.401(c) and 1926.500(d)(1), a citation for repeat violations of 29 CFR §§ 1926.400(h)(1) and 1926.500(e)(1)(ii), and the total proposed penalty of $1,320.00. Specifically, Respondent is charged with the

failure to have proper grounding devices on an electric drill and two extension cords, and with the failure to have a stairway and an open-sided floor properly guarded. The case was heard on September 30, 1981, at New York, New York.

## I S S U E S

1. Whether the violations existed at Respondent's workplace on March 5 and March 10, 1981.

2. If the violations existed whether any employee was exposed to any hazards created by the violations.

3. If employees were exposed, whether Respondent was responsible for the violations.

4. If Respondent was responsible, whether the violations were serious.

5. If the violations were serious, whether the penalties proposed were proper.

## STATEMENT OF THE EVIDENCE

On March 5, 1981, Respondent, as the electrical subcontractor, commenced work with three employees, at a worksite at 41st Avenue, Flushing, New York. The site consisted of five or six three level multiple dwellings under construction.

One of the employees, Mr. Frederick Hueberger was Respondent's representative at the site (T. 6, 8, 9, 64, 67). The three employees were installing electrical wiring and boxes on the ground floor of building No. 136-85 (T. 9). Sometime after the lunch hour but before 2:30 p.m., Compliance Officer Henry Piencinski observed Mr. Hueberger and another employee using a portable electric drill to drill holes in a floor beam on the ground floor of the building (T. 8, 10, 12-13).

The electric plug attached to the end of the electrical cord connected to the drill, was missing its third or ground prong. This plug was connected to a junction box which in turn was connected to an extension cord. The plug on the extension cord was missing its third or ground prong. The extension cord plug was connected to another extension cord which in turn was connected to an electrical power source. The plug on the second extension cord was fitted with an adapter which transformed the plug from a three-prong to a two-prong plug. The adapter had a ground wire which was not connected to any grounding source (T. 6, 7, 8-9, 10, 12-13, 14, 18-24, 25-26, 27, 30, 31; Exhs. C-1, C-2, C-3, C-4).

Officer Piencinski also observed that the electric drill was being used without a ground fault circuit interrupter. The interrupter would have cut off the electric current to the electric drill if a short or other electrical defect occurred,

and would have provided safety protection to an employee even though the electric plugs on the line, were defective or ineffective (T. 51, 52, 54, 55-58). Officer Piencinski believed that the two defective plugs, the ineffective adapter and the lack of a ground fault circuit interrupter exposed an employee using the electric drill to a possible serious electric shock or burn (T. 15, 23, 24, 26, 51-52).

Mr. Hueberger stated to Officer Piencinski that he did not know the third prong was missing from the plug on the cord of the electric drill; that he did not have a ground fault circuit interrupter; and that the two extension cords were at the site and were set up by some other trade (T. 15, 31, 59-60). These electrical wiring violations existed only on March 5, 1981, and were abated (T. 16, 24, 31, 32-33, 60).

Officer Piencinski assessed a proposed penalty, after allowing credits for size and good faith, of $240.00 for the defective plug on the portable drill cord, $240.00 for the two extension cord violations, and $480.00 for the ground fault circuit interrupter violation which was deemed a repeat violation (T. 16, 17, 18, 33, 58-59; Exh. C-6).

Respondent's employees worked at the site on March 5 and 6, 1981, and did not return to work until March 10, 1981 (T. 76). On March 10, 1981, Officer Piencinski also returned to the site and observed two of Respondent's employees, Mr. Hueberger and

one other employee, installing electrical wiring and boxes on the third floor of building No. 136-85 (T. 10, 34). To reach the third floor worksite, the employees used a six foot wide stairwell, three feet of which was taken up by a stairway. The stairway has no handrail at its open side. At the top and to the left of stairway on the third floor, was an unguarded open-sided floor which was six feet long on one side and nine feet at another side. The two unguarded open sides and the unguarded stairway formed three sides of the stairwell area. The two employees had access to these unguarded areas in going to and from their work area on the third floor (T. 34, 35, 36, 37-39, 40, 42, 44-45, 46; Exh. C-5 shows one of Respondent's employees using stairway without handrail and a portion of unguarded open-sided floor). Officer Piencinski and Mr. Hueberger spoke to the general contractor about the conditions. The general contractor immediately abated the conditions at the stairway and at the open-side floor (T. 44, 51).

Officer Piencinski believed the unguarded open-sided floor and the lack of a handrail on the stairway were serious and exposed Respondent's employees to fall hazards of 4 1/2 to 8 feet (T. 42, 47). Officer Piencinski proposed a penalty after allowing credits for size and good faith, of $120.00 for the open-side floor violation, and $240.00 for the stairway

violation which was deemed a repeat violation (T. 42, 48, 50, 51; Exh. C-6).

Officer Piencinski spoke to Mr Robert Cerrito, Respondent's owner. Mr. Cerrito told Officer Piencinski that on March 5, 1981, he did not allow his employees to work on the third floor because the stairway and guarding had not been installed. If he had known on March 10, 1981, that the conditions had not changed he would have prevented his employees from working on the third floor of the building (T. 44, 47).

Mr. Robert Cerrito, Respondent's owner, testified that he did not dispute the observations made by Officer Piencinski. He stated that all equipment that leaves his office is in proper condition and properly grounded; that the two extension cords belonged to a plumber at the site; and that he supplied Mr. Hueberger with a ground fault circuit interrupter (T. 67, 68, 79). He further stated that on March 5, 1981, the first day his employees were at the jobsite, he informed the general contractor that his men would not work in areas where stairways and other guarding features were missing. On the night of March 5, 1981, he was informed by the general contractor that the stairways and barriers had been erected (T. 68-70, 71). He periodically gave his employees instructions not to work in areas where guarding barriers and stairways were lacking, or where there were hazardous conditions (T. 70, 77).

Mr. Cerrito's main concern at the hearing was the penalty which he considered excessive (T. 70, 80).

## O P I N I O N

The unrefuted evidence which Respondent does not dispute, establishes that the violations for which Respondent was cited, existed at its worksite on March 5 and 10, 1981 (T. 67, 79). Respondent's primary concern at the hearing was the proposed penalties which it considered to be excessive (T. 70-71, 80).

Two of the serious violations and one of the repeat violations relate to a portable electric drill and two extension cords which connected the drill with a source of electrical power. The plug on the electric drill cord and the plug on one of the extension cords were missing a third or ground prong. The other extension cord was fitted with an adapter plug which transformed the three-pronged plug of the extension cord to a two-prong plug. The adapter has a ground wire which was not attached to any grounding source. In addition, Respondent failed to use a ground fault circuit interrupter with the electric drill. The defective plugs, the ineffective adapter plug and the lack of a ground fault circuit interrupter exposed the two employees who used the electric drill on March 5, 1981, to electric shock or burn hazards. Respondent was assessed a total proposed penalty of $960.00 for these three violations.

These violations existed for a short time, from the end of the lunch break to 2:30 p.m., the end of the workday, on March 5, 1981, and were abated by March 6, 1981. Two of Respondent's employees, during the time period, used the electric drill. Under the circumstances of this case which includes a full consideration of the statutory factors of Section 17(j) of the Act, and a determination that the three violations stem from the same general condition, the violations are consolidated for purposes of assessing a penalty. The total proposed penalty of $960.00, for the three violations is reduced to one penalty of $250.00, to cover the three violations.

The one remaining serious violation and the one remaining repeat violation relate to a fall hazard from an unguarded open-sided floor and an unguarded stairway. Two of Respondent's employees on March 10, 1981, used the unguarded stairway and had access to the unguarded open-sided floor adjacent to the stairway, when going to, and from, their workplace on the third floor of one of the buildings under construction. The hazardous conditions were immediately abated by the general contractor. Respondent was assessed a total proposed penalty of $360.00 for these two violations. Based on the same rationale used above to calculate the single penalty for the electrical violations, and considering the statutory factors

of Section 17(j) of the Act, the total proposed penalty of $360.00, is excessive and is reduced to one penalty of $100.00 to cover both violations.

## FINDINGS OF FACT

The credible evidence and the record as a whole establishes preponderant proof of the following specific findings of fact.

1. Respondent is in the electrical contracting business and maintains a place of business at 85-45 Grand Avenue, Elmhurst, New York.

2. Respondent's business affects commerce.

3. On March 5 and March 10, 1981, Respondent, as a subcontractor, was performing electrical work, at a worksite located at 136-77 to 136-85, 41st Avenue, Flushing, New York.

4. The worksite consisted of five or six three-level multiple dwellings under construction.

5. On March 5, 1981, Respondent had three employees installing electrical wiring and boxes on the ground floor of building No. 136-85.

6. On March 5, 1981, two of Respondent's employees in building No. 136-85, used a portable electric drill in their work.

7. The third or ground prong on the plug of the electric drill was missing. The electric drill was connected to a junction box extension cord.

8. The third or ground prong of the plug of the junction box extension cord was missing.

9. The junction box extension cord was connected to another extension cord which in turn was plugged into a source of electrical power.

10. The plug of the second extension cord was fitted with an adapter which transformed the three-prong plug of the cord to a two-prong plug.

11. The adapter was fitted with a grounding wire which was not attached to any grounding source.

12. There was no approved ground fault circuit interrupter used in conjunction with the portable electric drill.

13. The two defective electric plugs, the ineffective adapter plug and the absence of a ground fault circuit interrupter caused Respondent's two employees to be exposed to electric shock or burn hazards.

14. Respondent was responsible for the hazardous electrical conditions that existed on March 5, 1981, at its workplace.

15. The electrical hazard to which Respondent's employees were exposed, is serious in that an employee who received an electric shock or burn because of the hazard, could suffer serious physical harm.

16. The hazardous conditions existed for a brief time on March 5, 1981, and were abated no later than the opening of the workday on March 6, 1981.

17. The two serious and one repeat violations all stem from one general condition and will be consolidated for the purposes of assessing a single penalty for the three violations.

18. On March 10, 1981, an open-sided floor on the third floor of another building at the worksite, and an adjacent stairway leading to the third floor, were unguarded.

19. Respondent had two employees performing electrical work on the third floor of this building.

20. The two employees used the unguarded stairway to reach their third floor workplace and had access to the unguarded open-sided floor adjacent to the stairway.

21. The two employees were subject to fall hazards of 4 1/2 to 8 feet when using the unguarded stairway to reach the third floor, and when walking by the unguarded open-sided floor to their workplace on the third floor.

22. Respondent, although he had reason to believe that proper guarding was erected at the third floor and at the stairway, failed to adequately instruct his employees not to use the hazardous area if proper guards were not installed.

23. The hazardous conditions at the open-sided floor and stairway were immediately corrected by the general contractor upon being informed of the conditions by the compliance officer and Respondent's representative.

24. Respondent is responsible for the two fall hazard violations.

## CONCLUSIONS OF LAW

1. Respondent, is and at all times material herein was, engaged in a business affecting commerce within the meaning of Section 3(5) of the Act (29 U.S.C. § 652(5)).

2. The Occupational Safety and Health Review Commission has jurisdiction over the subject matter and parties to this action.

3. On March 5, 1981, Respondent was in serious violation of 29 CFR §§ 1926.401(a)(1) and 1926.401(c), and in repeat violation of 29 CFR § 1926.400(h)(1).

4. Under the circumstances of this case, with due consideration of the statutory factors of Section 17(j) of the

Act, the total proposed penalty of $960.00 for the violations of 29 CFR § 1926.401(a)(1), 1926.401(c) and 1926.400(h)(1) is excessive, and a single penalty of $250.00 is assessed to cover the three violations.

5. On March 10, 1981, Respondent was in serious violation of 29 CFR § 1926.500(d)(1) and in repeat violation of 29 CFR 1926.500(e)(1)(ii).

6. Under the circumstances of this case, with due consideration of the statutory factors of Section 17(j) of the Act, the total proposed penalty of $360.00 for the violations of 29 CFR § 1926.500(d)(1) and 1926.500(e)(1)(ii) is excessive and is reduced to a single penalty of $100.00, to cover both violations.

## O R D E R

Due deliberation having been had on the whole record, it is hereby

ORDERED that the citation (No. 1) for serious violations of 29 CFR §§ 1926.401(a)(1), 1926.401(c) and 1926.500(d)(1), is affirmed, it is further

ORDERED that the citation (No. 2) for repeat violations of 29 CFR §§ 1926.400(h)(1) and 1926.500(e)(1)(ii), is affirmed, it is further

ORDERED that the total proposed penalty of $1,320.00 is reduced to $350.00.

Appearances:

Ronnie A. Howell, Esq., of Dallas, Texas for the Complainant,

R. A. Hinton of Tulsa, Oklahoma for the Respondent.

## DECISION AND ORDER

Child, R. M., Judge, OSHRC:

### Statement of the Case

This matter is before the Occupational Safety and Health Review Commission (the Commission) pursuant to section 10(c) of the Occupational Safety and Health Act of 1970, 29 U.S.C. §651 et seq. (the Act). Complainant seeks affirmance of two items of serious Citation No. 1, issued to respondent January 30, 1981 and of the proposed penalty in the sum of $280.00 for each of said items.

The citation resulted from inspection of a trenching operation for the laying of a sewer pipe at Talala, Oklahoma on January 27, 1981. Notice of Contest was timely filed, and upon motion of complainant, to which respondent raised no objection, the matter proceeded as simplified proceedings.

The matter came on for conference and hearing before the undersigned judge at Tulsa, Oklahoma on September 21, 1981. Notice of the conference/hearing was duly posted. (Tr. 5) There was no appearance by or on behalf of affected employees.

In the course of the conference it was established and agreed to by the parties:

1. Complainant moved to amend item 1 of the citation to delete therefrom reference to 29 C.F.R. 1926.652(b).

2. Complainant moved to amend item 2 of the citation to designate the violation there described as an other than serious violation to which no penalty should be assessed.

3. Respondent consented to said motions to amend and moved to withdraw its notice of contest to item 2 as so amended.

4. The parties are in agreement that the soil at the point of the alleged violation was hard or compact and therefore properly covered by 29 C.F.R. 1926.652(c).

5. Respondent is a corporation engaged in commerce as contemplated in the Occupational Safety and Health Act of 1970.

6. The inspection out of which this action arises was authorized and accomplished with the consent of the respondent.

The motions to amend the citation and to withdraw the notice of contest to item 2 were granted.

Jurisdiction of the respondent and of the subject matter are not issues in this proceeding.

Upon completion of the conference, hearing proceeded on the following:

Issues

1. Was the respondent in violation of the standard at 29 C.F.R. 1926.652(c)

by reason of the trench in question being improperly sloped?[1/]

2. If the respondent was in violation was said violation serious?

3. What, if any, penalty would be appropriate?

The parties have each filed post-hearing memorandum, raising no issues of law.

## The Evidence

William B. Hinkle, the compliance officer who made the inspection in question was called as the complainant's only witness. Mr. Hinkle observed and photographed two of respondent's employees in the trench in question. (Tr. 17, 21; Exhibit C-1)

Mr. Hinkle had a conversation with the respondent's foreman who told him that a trench box which was on the job was not being used at the point where the two men

---

1/ A description of the alleged violation as amended and the standard involved:

### Citation

29 C.F.R. 1926.652(c); The side(s) of the trench(es) in hard or compact soil, including embankment(s), were not shored or otherwise supported when the trench was more than 5 feet in depth and more than 8 feet in length:

Two pipelayers were installing 8" clay tile pipe in an unshored and otherwise unprotected trench that was from 5'5" to 1'7" wide and from 7'8" to 8'4" deep and located at the intersection of Sequoyah and Maple in Talala, OK, exposing them to the hazard of being struck by soil in cave-in(s).

### Standard

§1926.652 Specific trenching requirements.

(c) Sides of trenches in hard or compact soil, including embankments, shall be shored or otherwise supported when the trench is more than 5 feet in depth and 8 feet Or more in length. In lieu of shoring, the sides of the trench above the 5-foot level may be sloped to preclude collapse, but shall not be steeper than a 1-foot rise to each 1/2-foot horizontal. When the outside diameter of pipe is greater than 6 feet, a bench of 4-foot minimum shall be provided at the toe of the sloped portion.

were observed to be working as shown in Exhibit C-1 because a waterpipe crossed the trench at that point which interferred with the use of the trench box. The foreman also claimed the trench to be adequately sloped in the area. (Tr. 19)

The depth of the trench to the point upon which the men shown in Exhibit C-1 are standing was measured by Mr. Hinkle to be 7 feet 8 inches below ground level. Below the surface upon which the men were standing was fill dirt covering an eight inch clay tile pipe. (Tr. 22, 45) Mr. Hinkle opined that the original depth of the trench before placing the pipe and the fill dirt was an estimated 8'6" or 8'8". (Tr. 23) The top of the water pipe which crossed the trench was two feet ten inches below ground level and at that point the trench was 5 feet 5 inches wide at ground level. (Tr. 25, 26, 47) Mr. Hinkle made no measurement of the width of the trench bottom but estimated it to be 4 to 4 1/2 feet wide. (Tr. 26, 35; Exhibit C-1)

Exhibits 2, 3 & 4 show the two workers standing in the manhole area at the north end of the allegedly offending trench. It is not alleged that any violation occurred in the manhole area. (Tr. 32) A trench box for protecting workers was observed and photographed about 100 yards from where the work was taking place. (Tr. 32; Exhibit C-5)

Assuming the bottom of the trench to be 4 1/2 feet wide and the trench to be 7 feet 8 inches deep, Mr. Hinkle testified the trench would have had to be 8 feet 1 inch wide at ground level in order to be in compliance. In his opinion death or serious injury would result to a worker in the trench being covered by "...a couple of tons of soil." (Tr. 39, 40)

Applying the usual concepts of establishing a base penalty giving due consideration to what he considered to be the gravity of the violation and discounting the base penalty for factors of respondent's size and good faith, Mr. Hinkle arrived at a figure of $280.00 which was the penalty proposed by the complainant for the

alleged violation. (Tr. 40-43) Mr. Hinkle did not measure the width of the bucket used to excavate this trench. (Tr. 59)

---

Mr. R. A. Hinton testified that the excavating bucket was 26 inches wide. (Tr. 61) The trench was dug one bucket wide, or 26 inches. (Tr. 67) There was no reason to dig it wider. The wider the trench, the more gravel is required beneath the pipe. (Tr. 68) The trench box on the job is designed to fit in a trench dug by a 26 inch bucket and it too is a 26 inch trench box. (Tr. 70)

Assuming an 8 foot 4 inch deep trench 26 inches wide at the bottom, a trench sloped to conform to the minimum requirements of the standard in question would be about 5 feet 8 inches wide at the top according to Mr. Hinton's calculations. (Tr. 74) Seldom do his excavators vary the bottom width of the trench more than two inches wider than its intended 26 inch width. (Tr. 80)

## Discussion

It must be remembered that complainant has the burden of proving a violation by a preponderance of the evidence. The compliance officer made only one measurement of the width of this trench, presumably at its narrowest point, and found it to be 5 feet 5 inches wide at ground level. At that point the work was hampered by a 1-inch waterpipe that crossed the trench at right angles 2 feet 10 inches below ground level. It could hardly be said - and there was no evidence - that this point was typical of the trench width conditions throughout its total length.

Aside from a suggestion that a photograph indicated one side of the trench to be sloped to a lesser degree than the other at the area of the crossing waterpipe, there was no evidence of the actual degree of sloping - or lack of it - of either wall above a point 5 feet from the bottom of the trench. It has been said, and in some instances rightly so, that one picture is worth a thousand words. However, in the experience of this judge photographs can be grossly misleading when

relied upon to show angles, heights or distances.

Here the compliance officer made no measurement of the width of the trench other than at its surface level at the point of the crossing waterpipe. His opinion as to the width of the trench at the elbow level of the workmen shown in Exhibit C-1 (Tr. 36) and at the level of their feet or where the pipe is shown to be resting on gravel in the same photograph is rejected. The best that can be said for that testimony is that it establishes that the walls of the trench are vertical to a point approximately 5 feet above the floor of the trench and that any sloping had to occur above that point. Mr. Hinkle's unverified estimate made from ground level that the base width of the trench was 4 to 4 1/2 feet gives way to Mr. Hinton's testimony that the trench was dug with an excavator using a 26 inch wide bucket. Mr. Hinton's testimony that the trench was one bucket wide and that his operators rarely exceeded that width by as much as two inches is consistent with what is observed in the photo, Exhibit C-1 where a portion of an eight inch pipe emerges from the trench into the wider manhole area and two 16" cement blocks are also observed. Obviously the trench width could barely accomodate three pipes of that dimension lying side by side.

Next we consider the depth of the allegedly offending trench. It has been conceded that no violation is contended for the manhole area. There was no testimony as to whether workmen were allowed into the trench prior to gravel, pipe and some fill dirt being placed. There was no measurement made as to the trench depth other than to the level of the fill dirt upon which the workmen were observed and photographed. At that point the trench in which the men were working was measured to be 7 feet 8 inches deep. Mr. Hinkle estimated from the width of the clay pipe and an allowance for a gravel bed that the original trench depth at the point where the men are shown to be standing in Exhibit C-1, was "8 feet 4 inches" or

"8 1/2 feet" or "8 feet 8 inches." However, there was no evidence that workers were permitted in the trench in its original condition.

As is pointed out by complainant in his Post-Hearing Brief:

> "This case is admittedly one of inches, as the Court noted at the hearing..."
>
> * * *
>
> Complainant and respondent both agree that the appropriate standard requires the trench in question to be sloped one-half foot horizontally for each one foot vertical rise, above the five-foot depth level. Once the proper dimensions of the trench are established, a simple calculation will allow the Court to determine if compliance has been achieved, provided the trench is properly sloped on both sides.
>
> * * *
>
> "...Therefore, using simple calculations it can be determined that if the trench width was five feet, five inches at the surface, and seven feet, eight inches deep, then if the trench was wider than two feet, nine inches, a violation existed..."

In this contest of inches the complainant has failed to meet his burden of proof. There is no probative evidence that either side of the trench failed to have adequate slope above the five foot level. The trench base according to the more credible testimony was at minimum 26 inches and at maximum 28 inches wide. There is no evidence that the walls of the trench rose other than vertically to the five foot level. There is evidence that both walls sloped outward above the five foot level.

---

Having considered the pleadings, the stipulations entered upon the record, the testimony of the witnesses, the Exhibits received in evidence and the post-hearing submittals - and having observed the demeanor of the witnesses and having weighed the credibility thereof - there are hereby entered the following:

## Findings of Fact

1. The surface width of the trench in question was five feet five inches at its narrowest point.

2. The depth of the trench where exposure was alleged to have occurred was seven feet eight inches.

3. The trench walls rose vertically to a point approximately five feet above the trench floor at the point where exposure is alleged to have occurred.

4. The width of the trench at its floor and to a point approximately five feet above said floor was a minimum of 26 inches and, in places, a maximum of 28 inches.

5. The walls of the trench above the five foot level sloped not less than 1/2-foot horizontal for each 1-foot rise.

## Conclusions of Law

1. The Commission has jurisdiction of the parties and the subject matter of these proceedings.

2. The complainant failed to meet his burden of proof of a violation of the standard at 29 C.F.R. 1926.652(c).

3. Item 1 of serious Citation No. 1, issued to respondent January 30, 1981 should be vacated and no penalty assessed.

4. Item 2 of said Citation No. 1 should be affirmed as an other than serious violation of the Act and no penalty assessed.

**ORDER**

1. Item 1 of serious Citation No. 1, issued to respondent January 30, 1981 is VACATED as is the penalty proposed therefore.

2. Item 2 of said Citation No. 1 is AFFIRMED as an other than serious violation and no penalty is assessed.

## NOTICE OF DECISION

Secretary of Labor v. Wright Industries, Incorporated
OSHRC Docket No. 80-6015

1. Enclosed is a copy of my decision. It will be filed with the Commission on December 22, 1981, and will become the final order of the Commission on January 21, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is January 21, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

APPEARANCES

Joseph T. Crawford, Esq.
For Complainant

David M. Neuhart, Esq.
For Respondent

DECISION AND ORDER

Chalk, Judge:

Following an inspection of an excavation dug by Respondent at Stanwix Street in Pittsburgh, Pennsylvania, during the evening hours of August 13, 1980, to expose a gas main for Equitable Gas Company, a citation for a serious violation was issued charging Respondent with failing to comply with 29 CFR 1926.651(v)[1/] in the following manner:

1/ This standard provides:

> In locations where oxygen deficiency or gaseous conditions are possible, air in the excavation shall be tested. Controls, as set forth in Subparts D and E of this part, shall be established to assure acceptable atmospheric conditions. When flammable gases are present, adequate ventilation shall be provided or sources of ignition shall be eliminated. Attended emergency rescue equipment such as breathing apparatus, a safety harness and line, basket stretcher, etc., shall be readily available where adverse atmospheric conditions may exist or develop in an excavation.

In locations where oxygen deficiency or gaseous conditions were possible, air in the excavation was not tested to assure acceptable atmospheric condition:

> (a) Ten foot wide by ten foot long by ten foot deep excavation for 24 inch gas line, on Stanwix Street at 4th Avenue; no tests were made, nor equipment available to perform the test prior to putting in shoring and cleaning around gas line.

Complainant proposed a penalty of $490 for this charge.

I

In a prehearing memorandum, Respondent asserted three reasons why the charge should not be affirmed - (1) lack of jurisdiction under the provisions of 29 U.S.C. 653 (b)(1),[2/] (2) vagueness of the standard, and (3) failure of Complainant to carry his burden of proof. As I agree with Respondent's third reason, the first two are mooted.

II

It was undisputed that Respondent contracted to dig and dug the excavation for Equitable, that the purpose was to expose a portion of a 24 inch pipe, otherwise referred to as a "main," through which natural gas, treated with an offensive smelling odorant called mercaptan, was transmitted for public consumption, that the excavation was 10 feet deep, wide and long, that Respondent did not use any man-made instrument to test the atmospheric conditions in the excavation and that Respondent had no such instrument at the worksite. It was also undisputed that the excavation was completely dug with a backhoe, except that after it was completed, but before Mr. Weyrauch arrived on the scene, an employee entered the excavation, apparently for a short period of time, to clean out the dirt by hand from under the

[2/] In asserting this argument, Respondent concedes that a majority of the Commission has already ruled adversely to its contention (Secretary v. Texas Eastern Transmission Corp., et al., 75 OSAHRC 88/D9, Docket Nos. 4091 & 4078).

exposed pipe, the bottom of the pipe being about 2 feet above the bottom of the excavation.

The foregoing facts prompted Mr. Weyrauch[3/] to recommend the issuance of the citation because he believed that "gas stays to the bottom of the trench [sic], its heavier than air;" thus, he thought there was the potential for gas to be in the bottom of the excavation (Tr. 48). He believed that the size of the excavation had no bearing on the possibility that an oxygen deficiency or a gaseous condition existed in the excavation because it was a confined space as that term was elsewhere defined in the construction standards, adding that it was his usual practice to require such testing under similar circumstances.

When questioned further about his practice, the following appears in the record:

> Q. Now, what I'm asking you is, how we determine how the Respondent was to determine whether or not an oxygen deficiency was possible and you've given me that standard, how were they to determine whether a gaseous condition was possible?
>
> A. They would test with a tester, equilizer.
>
> Q. But according to your violation Mr. Weyrauch, they only need to test if they detemine there was that possibility?
>
> A. And how would they determine that unless they test?
>
> Q. That's what I'm asking you sir.
>
> A. That's why we require the testing.
>
> Q. So in other words, you're saying that you don't require testing where it's possible, you require testing to determine if it's possible?
>
> A. We would require testing in any excavation that's considered could be a confined space for the potential of any gas leaks.

3/ Mr. Weyrauch's prior experience consisted of being a laborer in construction. Although he had attended various compliance officer courses when he first joined OSHA, he had no background in chemistry or chemical engineering, stating that he did not "profess to be an industrial hygienist" (Tr. 34).

Q. Does it say that in the regulation under which the citation was issued?

A. I can't speak for the — I didn't make the regulation.

Q. I'm not asking you if you made it, I'm asking you if it says it?

A. That's the way I interpret it, yes.

Q. Can you show me the language in the regulation that says anything about a confined space?

A. No, but in other portions of the construction standard[s], I can show you what a confined space is.

Q. But that's not the standard under which the citation was issued?

A. No sir.

* * *

JUDGE CHALK: Now, you have a copy of the standard there in front of you, do you not?

THE WITNESS: No I don't.

JUDGE CHALK: I'll just read what I'm interested in. The standard merely says, in the opening sentences, in locations where oxygen deficiency or gaseous conditions are possible.

THE WITNESS: Yes sir.

JUDGE CHALK: Air in the excavation shall be tested, and your interpretation is in that case, wherever there's a gas line, you have to test?

THE WITNESS: Yes sir.

JUDGE CHALK: It doesn't matter whether it's possible, it doesn't matter whether there's a leak or not?

THE WITNESS: No sir.

JUDGE CHALK: You're saying it's always possible?

THE WITNESS: Yes sir. (Tr. 34, 35, 36, 52, 53)

Finally, Mr. Weyrauch testified that he never tested for a leak in this excavation and in fact assumed that there was none, because "they didn't smell gas" (Tr. 33). He perceived the hazard to be the possibility of an employee being overcome or an explosion occurring, either one of which could have resulted in serious bodily harm.

Respondent's vice-president for operations for four years, Michael G. Robb, had previously worked for Equitable for 5 1/2 years, first as a "technical field man" and then as supervisor of distribution (Tr. 66). Both of these positions with Equitable placed him in charge of digging operations of this type on a daily basis. When he first joined Equitable, he was required to attend a six month's training course on the subject of natural gas,

> ...its physical properties, we had to review all of Equitable Gas' safety standards and OSHA's safety standards. (Tr. 66)

In his present position, Mr. Robb did

> ...all the bidding for Wright Industries and all their contract work and [he was] in charge of all our supervisors and operations, field supervisors and dispatching, safety, that's about it. (Tr. 65)

According to Mr. Robb, natural gas is not toxic, and it has lower and upper explosive limits and is lighter than air. If a leak of natural gas occurs below ground, a hole can be drilled into the ground and a 6-inch pipe can be installed that will "completely vent that area from the lower explosive limit" (Tr. 78, 79). When asked if it were necessary to blow air in through this pipe, he responded:

> They don't blow air in, they just put a standpipe on top of the hole and that six inch opening completely vents the whole hole.
>
> JUDGE CHALK: It rises through the pipe of its own accord?
>
> THE WITNESS: Right. (Tr. 79)

Moreover, according to Mr. Robb, Respondent's employees were routinely permitted to enter an excavation without prior testing even where there was a suspected leak, because it was "an open excavation, where you have natural venting" (Tr. 96).

Mr. Robb also said that because Equitable was a distributor of natural gas, the gas in its lines had to be odorized under regulations of the Office of Pipeline Safety, Department of Transportation, and that leaks were detected "Through the nose, you smell," even before the accumulation reached the lower explosive limit (Tr. 82). When asked if the smell could be detected during the digging process or not until "you've got the whole thing opened," he responded:

> No, at anytime, you could break the concrete and you could smell the gas and at that point they would stop, call the gas company, the gas company would determine whether we should dig it or they should dig it or they will stand by while we were digging it. (Tr. 83)

Finally, Mr. Robb testified that Equitable inspected the work of all contractors "all during the excavation and all during the work," and that he had instructed the foreman in this case and all other foremen in prior safety meetings that whenever the presence of gas was detected, all employees were to "stay out of" and "away from the hole"

> . . . because they don't have an explosive meter on their truck, to call Equitable Gas Company, call our dispatcher and our dispatcher calls Equitable Gas Company." (Tr. 52, 82, 84).

Dr. Charles Stefan Beroes received his doctorate degree as well as his bachelor's and master's degrees in chemical engineering and had taught chemical engineering at the University of Pittsburgh since 1950. In addition to his membership in numerous chemical engineering societies, he was a registered professional engineer in the State of Pennsylvania and did "quite a bit of consulting to corporations within the United States" (Tr. 110). He testified that natural gas

was primarily methane gas that had the density of approximately one-half that of air, thus rising "very rapidly" in air (Tr. 114). As this non-toxic gas was invisible and odorless, an odorant, mercaptan, a compound of sulpher hydrogen, that was readily detected by the sensor area of the human nose, was added. Actually, according to him, one part of mercaptan per million parts of natural gas was detectable by the human nose with "no trouble at all" (Tr. 115).

Having familiarized himself with the facts in this case, the allegations and the standard involved, Dr. Beroes was of the opinion that the existence of either an oxygen deficiency or gaseous condition in the excavation was scientifically impossible for several reasons:

> Probably the most important, single condition would be the light density, the low density of gas which would bring it immediately to rise up to the top of the excavation and out of the excavation, it would rise quite rapidly. The second condition would be that if we had as much as one part per million methane in the hole, it would be detectable by the human nostril and to have an oxygen deficiency we would need to have at least fifteen cubic feet in one thousand, that is fifteen volume percent oxygen, or a contaminate of methane to get the one and a half percent, one and a half percent of a thousand is fifteen, so fifteen cubic feet of methane.
>
> That is about a concentration of fifteen thousand times greater than that, that can be detected by the human nostril. So, it completely excludes the possibility of having an oxygen deficiency and then if there were any ambiant [sic] air movements, which are natural and this is on any one of our streets as well as Stanwix Street, the horizontal component of that air movement would sweep over the excavation and sweep it free of a lighter than air gas very rapidly with no chance of the gas settling, any air movement diluting it and sweeping it and its own, I'm just summarizing, its own light density causing it to rise rapidly. (Tr. 119, 120)

Moreover, because of "the keenness of the human nostril in detecting mercaptan, the presence of gas would also be very evident to anyone who was in the hole, that is in the excavation as well" (Tr. 122). It would also be detectable by anyone standing at the top of the excavation, although if the wind were blowing, it would

be more detectable on the downward side than on the other side. When asked if it were possible to have no ambient air movements, he responded:

> It's normal to have it, even in this [courtroom], you have quite a bit of ambient air movement because of strata, we're exhaling warmer air than we're inhaling and so on, but when we're talking about a gas that's only one half as dense as air, it's going to rise rather rapidly and cause movement. (Tr. 134)

After stating that the human nose could detect one cubic inch of the odorized natural gas in a "million cubic inches of area," Dr. Beroes said:

> Yes, and even more sensitive to that, the one cubic inch totally disbursed in the one million cubic inches and if you took one cubic inch of that gas, there would only be one molecule to a million molecules of air and the human nose, being the most sensitive of all instruments, we cannot construct instruments more sensitive, because it will actually detect parts per billion instead of parts per million, but it will pick that up. (Tr. 115)

Finally, Dr. Beroes testified that his testimony would be exactly the same if he were to assume that there was a gas leak some 1,500 feet away and that the gas, unvented, found its way into the excavation dug by Respondent.[4/]

III

In his posthearing brief, Complainant argues that the Commission has jurisdiction over the proceedings, and that he has sustained his burden of proving that Respondent was in serious violation of the Act.

In its posthearing brief, Respondent repeats its three arguments advanced in its prehearing memorandum in support of its claim that the charge must be vacated. In addition, it takes sharp issue, as it did at the hearing, with Mr. Weyrauch's interpretation of 29 CFR 1926.651(v) and his application of the term "confined space" to the charge.

---

4/ Counsel for Complainant questioned Dr. Beroes on this subject apparently because Mr. Robb testified that there was such a leak discovered by Equitable in one of its lines. Although the potentiality of this issue is of no consequence in light of Dr. Beroe's statement that his testimony would be the same without regard to the source of a natural gas leak, I nevertheless read Mr. Robb's testimony as stating that Equitable vented this leak by drilling "bar holes" (Tr. 76).

I agree that Mr. Weyrauch's interpretation of 29 CFR 1926.651(v) at the hearing was confusing, because he repeatedly said that the standard required Respondent to test in order to determine the possibility whether either of the two specified conditions existed in the excavation, quite the opposite of what the standard requires. However, as this excavation was dug to expose a pipeline that transmitted natural gas, he may have been inartfully expressing the opinion that the mere presence in an excavation of such a pipeline itself created the possibility that triggered the requirement for testing. In either case, the posture of the evidence in this case is such that I need not choose sides on this issue.

For the same reason, I need not assess his application of the term "confined space" to the charge for prejudice, although I am satisfied that under the facts of this case, it was improper for him to do so.

The term "confined space" itself is not mentioned anywhere in 29 CFR 1926.651 and the only definition I am aware of is that contained in 29 CFR 1926.21 entitled "SAFETY TRAINING AND EDUCATION." That standard enjoins employers to instruct their employees in the recognition and avoidance of hazards incidental to their workplaces.

As Respondent was not charged with failing to instruct its employees, and the definition itself limits its application solely to that standard (29 CFR 1926.21(b)(6)(ii)), it is inapplicable to this case. However, even were I to conclude otherwise, I doubt that the definition is broad enough to cover the excavation in this case (see Secretary v. Pittsburgh-Des Moines Steel Co., et al., 76 OSAHRC 120/D1, Docket Nos. 7290, 7291, 7301).

As I view the record evidence, Complainant's entire case rested on Mr. Weyrauch's misconception of the density of natural gas in relation to the density of air. Of course, Respondent's two witnesses, both knowledgeable in the use and

properties of natural gas, albeit deriving their expertise from entirely different sources, testified that natural gas is lighter than air, with Dr. Beroes adding that because it was about one-half the density of air, it rises "very" or "quite" rapidly. I accept the opinions of these two witnesses over that of Mr. Weyrauch.[5/]

Although this property of methane, alone, persuasively suggests that neither an oxygen deficiency nor a gaseous condition was possible in the excavation, a conclusion actually expressed by Dr. Beroes, I shall not rest my decision on that theory. Instead, I will briefly pursue an alternate route through the evidence, including of course the gas' natural venting property, in reaching my conclusion that Complainant's proof is totally deficient to sustain his charge.

The natural gas in this case, as required by a regulation of another Federal agency, was treated with mercaptan, an odorant described by Dr. Beroes as offensive or "smelly," as natural gas itself is odorless. Thus, given the venting property of natural gas, its treatment with the offensive smelling mercaptan, the size of the excavation and its location outdoors, and Dr. Beroes' testimony that air currents, sometimes seemingly nonexistent, exist even in occupied, closed rooms, I conclude that there was no possibility that any natural gas having its source in the excavation could have gone undetected through the sense of smell by Respondent's employees digging the excavation, long before any employee would have had occasion to enter it. Therefore, under the facts in this case, Respondent was not obligated to conduct the test required by the standard because the conditions specified in the standard could not possibly have existed in the excavation. My analysis of the evidence, however, does not end at this point.

Although the standard requires a test under the conditions it specifies, it does not identify any particular type of test to be performed, nor does it direct

---

5/ Webster's International Dictionary defines methane as "a colorless odorless flammable gaseous saturated hydrocarbon $CH_4$ that is lighter than air." (emphasis added)

employers to any other standard for that information. Therefore, it clearly allows an employer to use any test of his choice, so long as it is one that serves to accomplish the objective of the standard.

Dr. Beroes testified that the human nose was the most efficacious way of testing for the presence of methane treated with mercaptan because man-made instruments could not be designed with such a degree of sensitivity. Therefore, I conclude that Respondent actually complied with the testing requirement of the standard merely by placing employees at the worksite to dig the excavation. The record attests to the fact that none of them smelled mercaptan treated methane during the entire operation. Mr. Weyrauch also did not detect such an odor during the time he was conducting the inspection.

The charge will be vacated.

IV

Having reviewed the briefs of the parties, I reach the findings of fact and conclusions of law that follow.

FINDINGS OF FACT

1. Natural gas, or methane, is about one-half as heavy as air and thus rises rapidly in air.

2. As natural gas is odorless, the natural gas involved in this case was treated with an odorant called mercaptan, an offensive smelling agent to which the human nose is extremely sensitive.

3. The human nose will detect the presence of mercaptan treated natural gas more readily than man-made instruments designed for that purpose.

4. At the time and place alleged, Respondent dug an excavation 10 feet in width, length and depth to expose a 24 inch pipe used by Equitable Gas Company to transmit mercaptan treated natural gas for public consumption.

5. Because of the natural venting property of natural gas and the size of the excavation, there was no possibility of the existence of an oxygen deficiency or a gaseous condition in the excavation.

6. If there had been a leak of mercaptan treated natural gas in the excavation, Respondent's employees digging the excavation or otherwise standing around the top of the excavation would have smelled it before any employee had occasion to enter the excavation.

7. Respondent's employees detected no odor of natural gas emanating from the excavation.

8. There was evidence that there was a natural gas leak in the excavation.

## CONCLUSIONS OF LAW

1. The Commission has jurisdiction over the proceedings.

2. Under the circumstances of this case, testing by the use of the human nose for the presence of mercaptan treated natural gas emanating from the excavation constituted compliance with the testing requirement of 29 CFR 1926.651(v).

3. Respondent did not violate 29 U.S.C. 654(a)(2) by not complying with 29 CFR 1926.651(v).

V

Citation number 1 for serious violation is vacated.

So ORDERED.

DECISION

Before ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

A decision of Administrative Law Judge George W. Otto is before the Commission for review pursuant to section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). Judge Otto affirmed three nonserious items alleging that General Motors Corporation ("GMC") violated several occupational safety and health standards for general industry. In his decision, the judge declined to consider certain affirmative defenses which GMC raised at the hearing. For the following reasons, we hold that the defenses should have been considered and, having considered them now, we affirm two of the three items as nonserious violations and the remaining item as a de minimis violation. We also deny a motion filed by GMC before

the judge's decision was filed with the Commission in which GMC asserts that the decision must be vacated because of lack of subject matter jurisdiction.

I

GMC asserts in its motion that the judge and the Commission were deprived of subject matter jurisdiction over this case when, while it was pending before Judge Otto, the Secretary of Labor ("the Secretary") gave "final" approval to the occupational safety and health plan implemented by the State of Michigan. GMC relies on section 18 of the Act, 29 U.S.C. § 667.

On October 28, 1976, an Occupational Safety and Health Administration ("OSHA") compliance officer inspected GMC's Warren, Michigan plant. On November 17, 1976, OSHA issued to GMC a nonserious citation, three items of which are at issue in this case. On December 9, 1976, GMC filed a notice of contest which, pursuant to section 10(c) of the Act, 29 U.S.C. § 659(c), OSHA forwarded to the Commission so that a hearing could be held.

When these events occurred, Michigan was in the process of developing and implementing a state occupational safety and health plan pursuant to section 18 of the Act. Section 18 provides that any state may submit to the Secretary a state plan for the development and enforcement of occupational safety and health standards covering issues on which OSHA has developed standards. Section 18(b), 29 U.S.C. § 667(b). The Secretary must approve the plan if it meets certain criteria stated in section 18(c), 29 U.S.C. § 667(c). Michigan had submitted such a plan, which the Secretary approved under section 18(c). See 38 Fed. Reg. 27388 (1973).

After the Secretary approves a plan under section 18(c), he has discretion to continue to exercise his own enforcement authority under the Act in the state. Section 18(e), 29 U.S.C. § 667(e). However, after at least three years of discretionary enforcement, the Secretary may determine "that the criteria set forth in subsection (c) are being applied" and, after making this determination, the Secretary's enforcement authority in the state is substantially circumscribed:

> Upon making the determination referred to in the preceding sentence, the provisions of section 5(a)(2), 8 (except for the purpose of carrying out subsection (f) of this section), 9, 10, 13, and 17, and standards promulgated under section 6 of the Act, shall not apply with respect to any occupational safety or health issues covered under the plan, but the Secretary may retain jurisdiction under the above provisions in any proceeding commenced under section 9 or 10 before the date of determination.

Section 18(e), 29 U.S.C. § 667(e). Basically, the Secretary may not initiate enforcement proceedings concerning issues covered by the state plan but he may "retain jurisdiction" in enforcement proceedings initiated before he made the determination to which this part of section 18(e) refers.

GMC contends that, while this case was pending before Judge Otto, the Secretary made the "final" determination with respect to the Michigan state plan and thereby triggered the jurisdictional limitation in section 18(e). GMC also contends that, because section 18(e) mentions only that "the Secretary may retain jurisdiction," it is plain that neither the Commission nor an administrative law judge retains jurisdiction. Therefore, GMC asserts that the judge's decision must be vacated.

As the "final" determination, GMC refers to the Secretary's announcement on March 22, 1977, which stated that the Michigan plan became "operational" as of January 6, 1977,[1/] and that, therefore, OSHA and Michigan entered into an agreement limiting federal enforcement in the state. The announcement also stated that, in accordance with the agreement, 29 C.F.R. § 1952.262 was published concerning the level of federal enforcement under the Michigan plan.

Section 1952.262 provides that OSHA will not initiate enforcement proceedings concerning issues covered by standards in 29 C.F.R. Part 1910 and Part 1926 except to enforce subsequently promulgated OSHA standards until Michigan adopts "equivalent" standards. Section 1952.262 also provides for OSHA investigations and inspections to evaluate the plan under sections 18(e) and (f) of the Act, 29 U.S.C. §§ 667(e) and (f), which provide for continuing evaluation of the state's implementation of its plan.

The Secretary's announcement and section 1952.262 do not at any point state that the Secretary has made the "final" section 18(e) determination which limits his authority as a matter of law. Additionally, the determination of operational status is not the "final" section 18(e) determination. The "Background" statement in the announcement states:

> Part 1954 of Title 29, Code of Federal Regulations, sets out procedures under section 18 of the Occupaional Safety and Health Act of 1970 ( 29 U.S.C. 667) (hereinafter referred to as the Act) for the evaluation and monitoring of State plans which have been approved under section 18(c) of the Act and 29

---

1/ GMC also refers to a determination effective December 6, 1977. However, GMC does not show where this was published and we have not found it in the Federal Register. We accordingly conclude that only the March 22, 1977 determination is in question.

> CFR Part 1902. Section 1954.3 of this chapter provides guidelines and procedures for the exercise of discretionary concurrent Federal enforcement authority under section 18(e) of the Act with regard to Federal standards in issues covered under an approved State plan. In accordance with § 1954.3(b) of this chapter, Federal enforcement authority will not be exercised as to occupational safety and health issues covered under a State plan where a State is operational.

42 Fed. Reg. 15411 (emphasis added). Because section 1954.3 concerns the exercise of discretionary concurrent OSHA enforcement authority while a plan is being evaluated and monitored under section 18(e) subsequent to section 18(c) approval, the operational status accorded pursuant to section 1954.3(b) is no more than a step in development of the final state plan. See AFL-CIO v. Marshall, 570 F.2d 1030 (D.C. Cir. 1978). The status is not a determination that the plan has the "final" approval of the Secretary. See 29 C.F.R. § 1954.3.

Moreover, Michigan and OSHA entered into an agreement to limit OSHA's exercise of its discretionary enforcement authority and OSHA agreed not to initiate certain enforcement activity. OSHA continued to have discretionary enforcement authority and this determination of "operational status" did not limit OSHA authority as a matter of law under section 18(e). See General Motors Corp., Central Foundry Division, 80 OSAHRC 42/A2, 8 BNA OSHC 1298, 1980 CCH OSHD ¶ 24,452 (No. 78-2696, 1980). In addition, in section 1952.262, OSHA stated that it may recommend resumption of its enforcement authority "under section 18(e)" to assure occupational safety and health protection. Accordingly, because the Secretary had not made a "final" section 18(e) determination respecting the Michigan plan, GMC's basis for contending that we have been divested of jurisdiction is based on a misconception of the status of the Michigan plan.

However, even if the Secretary had given "final" approval to that plan, we would still conclude that we retain jurisdiction over this case. Because section 18(e)'s reference to the Secretary's retention of jurisdiction concerns proceedings commenced under sections 9 or 10, the discretion given to the Secretary by section 18(e) to "retain jurisdiction" can only mean that the Secretary has the option of continuing with the proceedings in any case commenced under sections 9 or 10 before "final" approval was given to a state plan. If the Secretary decides to continue prosecuting such a case, the Commission must retain jurisdiction, for otherwise the Secretary would have no forum in which the case could proceed. Accordingly, we would deny GMC's motion even if the Secretary had given "final" approval to the Michigan state plan.[2/]

II

In its answer, GMC denied the Secretary's alleged violations of crane inspection, housekeeping, and electrical standards (the three nonserious items at issue in this case) and pleaded, as the only "Affirmative Defense," that the Secretary's complaint failed to state a claim upon which relief could be granted. At the hearing, GMC's attorney stated, however, that GMC would rely on affirmative defenses that compliance with the housekeeping standard was impossible, that the electrical standards are vague, and that compliance with them would create a greater hazard. The Secretary's attorney moved to strike these defenses.

---

2/ GMC argues that it would be inequitable to subject it to two sets of standards, federal and state, which could contain "inconsistent obligations." However, GMC has not shown any conflict between state and federal requirements relevant to the alleged violations in this case. Accordingly, we need not address this potential problem of the concurrent authority contemplated by section 18(e).

He argued that GMC waived them in its answer to the complaint and claimed prejudice because further discovery would be needed to meet them.

Judge Otto reserved ruling on the Secretary's motion. During the hearing, evidence was presented on the defenses without objection by the Secretary. However, at the close of the hearing, the Secretary's attorney reiterated the Secretary's objections and asked for a continuance if GMC's defenses were allowed.

In his decision, Judge Otto disallowed GMC's impossibility and greater hazard defenses on the basis that they were raised too late in the proceedings. He reasoned that the Secretary is entitled to notice of affirmative defenses either in the answer or, at the latest, during a prehearing conference. However, Judge Otto additionally stated, "The stated affirmative defenses, if timely, would have failed to negate the . . . violation items. . . ." He also discussed GMC's vagueness defense on its merits and concluded that the electrical standards are not vague.

GMC argues on review that general notice of affirmative defenses was given in GMC's answer, which included the plea of failure to state a claim upon which relief could be granted. GMC asserts that the Secretary could have used discovery to learn the specific nature of the affirmative defenses. In any event, GMC asserts, the judge should have granted a continuance rather than striking the defenses. The Secretary argues that affirmative defenses must be specifically pleaded in the answer and that the plea of failure to state a claim did not give notice of GMC's affirmative defenses. However, the Secretary does not continue to claim prejudice.

Federal Rule of Civil Procedure 8(c)[3/] requires a defendant to affirmatively plead in its answer any matter that is an affirmative defense under applicable law. See United States v. Demmon, 72 F.Supp. 336 (D. Montana, 1947); see generally 5 WRIGHT AND MILLER, FEDERAL PRACTICE AND PROCEDURE § 1271. By the time of the inspection in this case, the affirmative defenses of vagueness of a standard, impossibility of compliance, and greater hazard had been recognized by the Commission. See Brady-Hamilton Stevedore Co., 75 OSAHRC 5/D9, 3 BNA OSHC 1925, 1975-76 CCH OSHD ¶ 20,342 (No. 2265, 1976) (vagueness as a defense); River Terminal Railway Co., 75 OSAHRC 13/A2, 3 BNA OSHC 1808, 1975-76 CCH OSHD ¶ 20,215 (No. 4419, 1975) (an employer's claim of vagueness must be raised sufficiently before the hearing to allow development of a record); Garrison & Associates, Inc., 75 OSAHRC 51/D5, 3 BNA OSHC 1110, 1974-75 CCH OSHD ¶ 19,550 (No. 4235, 1975) (lead and concurring opinions), and cases cited therein (impossibility as an affirmative defense); Lee Way Motor Freight, Inc., 75 OSAHRC 20/E12, 3 BNA OSHC 1843, 1975-76 CCH OSHD ¶ 20,250 (No. 7674, 1975), and cases cited therein (greater hazard as an affirmative defense). Therefore, GMC was required to affirmatively plead these defenses.

GMC's reliance on its plea of failure to state a claim for relief is misplaced. This plea only challenges the sufficiency of the Secretary's complaint alleging the factual and legal basis of his claim. It does not raise any affirmative defenses except if the complaint alleges

---

3/ Unless the Commission adopts a different rule, its proceedings are governed by the Federal Rules of Civil Procedure ("Federal Rules"). Section 12(g), 29 U.S.C. § 661(f).

In pertinent part, Federal Rule 8(c) provides, "In pleading to a preceeding pleading, a party shall set forth affirmatively . . . any other matter constituting an avoidance or affirmative defense."

the facts of a defense along with the claim. See Pointer v. American Oil Co., 295 F.Supp. 573 (S.D. Indiana, 1969); see generally 5 WRIGHT AND MILLER, FEDERAL PRACTICE AND PROCEDURE §§ 1355, 1356, 1357 along with § 1202 on Federal Rule 8(a). Accordingly, GMC's plea in its answer did not give notice of affirmative defenses.

Although GMC did not raise the defenses until the hearing, the answer can be amended to include them so long as the opposing party is not prejudiced. See Fed. R. Civ. P. 15(b); Texland Drilling Corp., 80 OSAHRC 106/C13, 9 BNA OSHC 1023, 1980 CCH OSHD ¶ 24,954 (No. 76-5307, 1980); Bill C. Carroll Co., 79 OSAHRC 47/C13, 7 BNA OSHC 1806, 1979 CCH OSHD ¶ 23,940 (No. 76-2748, 1979); see generally 5 WRIGHT AND MILLER, FEDERAL PRACTICE AND PROCEDURE § 1278. In this case, the affirmative defenses were raised at the outset of the hearing and, because the judge reserved ruling on the Secretary's motion to strike, these issues were tried. Furthermore, the record reflects that at an informal conference between counsel prior to the hearing GMC advised the Secretary of its intention to raise certain affirmative defenses. As a result, the Secretary had notice that the defenses might be allowed and had an opportunity to explore the defenses with all witnesses. Moreover, although the Secretary claimed prejudice in his argument to the judge, there has been no showing of actual prejudice and the Secretary does not argue prejudice on review. Accordingly, we amend the answer to add the defenses and shall consider the merits of the defenses.

III

Judge Otto affirmed item 1 of the nonserious citation, in which the Secretary alleged that "[f]requent inspections of the cranes and lifting equipment [were] not performed and recorded as required" by 29 C.F.R.

§ 1910.179(j)(2).[4/] Judge Otto found that GMC's crane records were three or four months behind and that during three months no crane inspections

---

4/ The standard provides:

§ 1910.179 Overhead and gantry cranes.

* * *

(j) Inspection —

* * *

(2) Frequent inspection. The following items shall be inspected for defects at intervals as defined in paragraph (j)(1)(ii) of this section [which states that frequent inspection means inspection at daily to monthly intervals] or as specifically indicated, including observation during operation for any defects which might appear between regular inspections. All deficiencies such as listed shall be carefully examined and determination made as to whether they constitute a safety hazard:

(i) All functional operating mechanisms for maladjustment interfering with proper operation. Daily.

(ii) Deterioration or leaking in lines, tanks, valves, drain pumps, and other parts of air or hydraulic systems. Daily.

(iii) Hooks with deformation or cracks. Visual inspection daily; monthly inspection with signed reports. For hooks with cracks or having more than 15 percent in excess of normal throat opening or more than 10° twist from the plane of the unbent hook refer to paragraph (1)(3)(iii)(a) of this section.

(iv) Hoist chains, including end connections, for excessive wear, twist, distorted links interfering with proper function, or stretch beyond manufacturer's recommendations. Visual inspection daily; monthly inspection with signed report.

(v) [Reserved]

(vi) All functional operating mechanisms for excessive wear of components.

(vii) Rope reeving for noncompliance with manufacturer's recommendations.

were made other than daily visual inspections of upper limit switches. On review, GMC contends that these findings have insufficient support and do not show a violation.

We have reviewed the record in light of GMC's arguments, which are basically the same as made to Judge Otto. We conclude that the factual findings are supported by a preponderance of the evidence, and that the item was properly affirmed. Accordingly, we affirm the judge's decision on this item. See Gulf Oil Co., 77 OSAHRC 216/B10, 6 BNA OSHC 1240, 1978 CCH OSHD ¶ 22,737 (No. 14281, 1977).

IV

Judge Otto affirmed item 10, which alleged that GMC failed to comply with 29 C.F.R. § 1910.22(a)(1)[5/] because the floor of the "hy-bay basement" was "covered" with "metal scrap and deep puddles of oil." The hy-bay basement is a 1000-foot by 150-foot area through which a main scrap conveyor and several feed conveyors carry metal scrap to the outside from the ground level plant floor, where metal forming presses are located. Service employees, including millwrights, electricians, pipefitters, and machine repairmen, generally pass through or work in the basement on a daily basis. When the conveyors are operating properly, they are adequate to convey most of the scrap out of the basement. However, GMC additionally employs clean-up crews, consisting of four or five

---

5/ The standard provides:

§ 1910.22 General requirements.

* * *

(a) Housekeeping. (1) All places of employment, passageways, storerooms, and service rooms shall be kept clean and orderly and in a sanitary condition.

employees per shift for three shifts, to clean up any metal scrap that falls from the conveyors onto the basement floor and to hose away accumulations of oil. During a 24-hour period, the three clean-up crews can generally clean the entire basement.

About once a month, one or more conveyors may break down. Because the presses on the ground floor continue to operate, metal scrap falls from the conveyors onto the basement floor in more than usual amounts. Additional employees may be assigned as needed to assist the clean-up crews to stack the scrap in piles and rows. Also, the clean-up crews will clean any area of the basement in which an employee has to work if the employee makes a request.

The judge found that there was metal scrap and oil on the hy-bay basement floor at the time of the inspection and that service employees had access to the poor housekeeping conditions. He also found that larger clean-up crews could have reduced the scrap and oil build-up.

On review, GMC argues that no employees were exposed except the clean-up crews and that the floor was not unreasonably unclean, disorderly or unsanitary. We conclude that the judge's factual findings on employee access to noncomplying conditions and on the possibility of more effective clean-up are supported by a preponderance of the evidence. Because GMC did not show that compliance would prevent performance of required work or that compliance would be functionally impossible, GMC has not established an impossibility defense. See Frank Swidzinski Co., 81 OSAHRC 4/E14, 9 BNA OSHC 1230, 1981 CCH OSHD ¶ 25,129 (No. 76-4627, 1981); cf. Marinas of the Future, Inc., 77 OSAHRC 201/B1, 6 BNA OSHC 1120, 1977-78 CCH OSHD ¶ 22,406 (No. 13507, 1977) (section 1910.22(a)(1) citation vacated because the record established that the

materials and tools on the floor at the time of the inspection were not in excess of those required to accomplish the work being performed). However, because the safety and health of employees was not substantially diminished, we conclude that the violation was de minimis. See General Motors Corp., Rochester Products Division, 81 OSAHRC 30/E13, 9 BNA OSHC 1575, 1981 CCH OSHD ¶ 25,279 (No. 78-2894, 1981), and cases cited therein.[6/] Accordingly, we assess no penalty and do not require additional abatement measures.

V

Judge Otto affirmed item 13, which alleged that, because the "electrical disconnects controlling the conveyors throughout the plant had overcurrent devices located over 12 feet in the air," the overcurrent devices were not "readily accessible" as required by the National Electrical

---

6/ Under Commission precedent a violation is properly classified as de minimis only where the relationship of the violation to employee safety and health is so remote as to be negligible. General Motors Corp., Rochester Products Division, supra (lead and dissenting opinions); Continental Oil Co., 79 OSAHRC 42/C3, 7 BNA OSHC 1432, 1979 CCH OSHD ¶ 23,626 (No. 13750, 1979). Commissioner Cottine concludes that, because this violation has a direct and immediate relationship to employee safety and health, it is nonserious rather than de minimis. See Gallo Mechanical Contractors, Inc., 80 OSAHRC 122/A2, 9 BNA OSHC 1178, 1981 CCH OSHD ¶ 25,008 (No. 76-4371, 1980); Southwestern Electric Power Co., 80 OSAHRC 81/C7, 8 BNA OSHC 1974, 1980 CCH OSHD ¶ 74,732 (No. 77-3890, 1980) (dissenting opinion).

In Commissioner Cottine's view, the Secretary has established the existence of conditions presenting fall hazards from either tripping or slipping. GMC has not shown that these conditions have been rendered insignificant by efforts made to control accumulations of scrap and oil. In addition, employees are exposed to the hazards on a regular basis and the injury that could result from the fall hazards associated with tripping or slipping cannot be viewed as negligible. A fall against structural supports located in the basement, onto metal scrap littering the floor, or even onto the concrete floor itself could result in injury. See Gallo Mechanical Contractors, Inc., supra.

Code ("NEC"). The Secretary alleged that GMC violated section 240-16[7/] of the NEC and 29 C.F.R. § 1910.309(a).[8/] The Secretary also alleged

---

7/ The cited provision of the NEC provides:

Article 240 — Overcurrent Protection

* * *

240-16. Location in Premises. Overcurrent devices shall be located where they will be:

(a) Readily accessible, except as provided in sections 230-91 and 230-92 for service equipment and section 364-11 for busways.

(b) Not exposed to physical damage.

(c) Not in the vicinity of easily ignitible material.

(d) Occupant shall have Ready Access. Each occupant shall have ready access to all overcurrent devices protecting the conductors supplying his occupancy.

Exception: In a multiple-occupancy building where electric service and electrical maintenance are provided by the building management and where these are under continuous building management supervision, the service overcurrent devices and feeder overcurrent devices supplying more than one occupancy may be accessible to authorized management personnel only.

8/ The standard provides, in pertinent part:

§ 1910.309 National Electrical Code.

(a) The requirements contained in the following articles and sections of the National Electrical Code, NFPA 70-1971; ANSI C1-1971 (Rev. of C1-1968) shall apply to all electrical installations and utilization equipment:

* * *

Sections

* * *

240-16(a), (b), (c), and (d). Location in Premises (for Overcurrent Protection Devices).

that GMC violated section 430-107[9/] of the NEC and 29 C.F.R. § 1910.309(b).[10/] GMC contends that the judge's decision was in error in several respects, which we consider in turn.

A

Sections 1910.309(a) and (b) are in "Subpart S — Electrical" of Part 1910. The first provisions in this subpart, 29 C.F.R. §§ 1910.308(a) and (b), state the following:

> (a) General. Section 1910.309 adopts as a national consensus standard the National Electrical Code NFPA 70-1971; ANSI C1-1971 (Rev. of C1-1968), which is incorporated by reference in this subpart.
>
> (b) Purpose of the National Electrical Code. (1) The purpose of the National Electrical Code is the practical safeguarding of any persons and of buildings and their contents from hazards arising from

---

9/ The cited provision of the NEC provides:

> Article 430 — Motors, Motor Circuits and Controllers
>
> * * *
>
> H. Disconnecting Means
>
> * * *
>
> 430-107. Readily Accessible. One of the disconnecting means shall be readily accessible.

10/ The standard provides:

> § 1910.309 National Electrical Code.
>
> * * *
>
> (b) Every new electrical installation and all new utilization equipment installed after March 15, 1972, and every replacement, modification, or repair or rehabilitation, after March 15, 1972, of any part of any electrical installation or utilization installed before March 15, 1972, shall be installed or made, and maintained, in accordance with the provisions of the 1971 National Electrical Code, NFPA 70-1971; ANSI C1-1971 (Rev. of C1-1968).

> the use of electricity for light, heat, power, radio, signalling, and for other purposes. The standards contained therein are occupational safety and health standards to the extent that they safeguard any person who is an employee of an employer.
>
> (2) The National Electrical Code contains basic minimum provisions considered necessary for safety.

Because section 1910.308(b)(1) says that the NEC standards are occupational safety and health standards "to the extent that they safeguard any person who is an employee of an employer," GMC contends that the Secretary adopted only a part of the NEC, that is, the NEC provisions affecting the safety of employees. Because the Secretary has not stated which NEC standards have this effect and are therefore adopted, GMC contends that the Secretary's adoption of the NEC standards was improper and the Secretary's electrical standards are impermissibly vague. Judge Otto rejected these contentions on the basis that the cited NEC standards cover employees. We agree that the contentions must be rejected and add the following comments.

In several places, the electrical standards straightforwardly indicate that the whole NEC was adopted. Section 1910.308(a) states, "Section 1910.309 adopts . . . the National Electrical Code . . . which is incorporated by reference in this subpart." Section 1910.309(a), note 8 supra, concerns the broad class of "all electrical installations and utilization equipment," no matter when it was installed, and lists the NEC provisions which apply to all such equipment. Section 1910.309(b), note 10 supra, pertains to a subclass of such equipment — equipment installed or repairs and improvements made after March 15, 1972 — and states that the installation, repair, or improvement "shall be in accordance with the provisions of the 1971 National Electrical Code. . . ."

These provisions imply that in time the whole NEC is to apply to all electrical installations and utilization equipment.

Section 1910.308(b)(1), on which GMC relies, does not necessarily indicate the contrary. It states that the NEC's purpose is the protection of people, as well as buildings and their contents. Therefore, the statement that NEC standards are OSHA standards "to the extent that they safeguard any person who is an employee . . ." simply indicates that "people" includes "employees" present on the site of electrical equipment.[11/] Essentially, then, section 1910.308(b)(1) indicates that the whole NEC is adopted because it protects employees.

Since Subpart S states that the whole NEC is adopted and specifies which NEC standards apply depending on when the electrical equipment was installed, repaired, or improved, adequate notice of the requirements was given. Accordingly, we reject GMC's arguments of vagueness and improper adoption.

B

We turn now to the alleged violation. GMC uses many electrically-powered conveyors to transport parts. Several hundred employees work along the conveyors removing and replacing parts in connection with

---

11/ The NEC provisions cited in this case were not deleted as occupational safety and health standards in the Secretary's new electrical standards, 29 C.F.R. §§ 1910.301-1910.399. See § 1910.304(e)(1)(iv), (v); § 1910.305(j)(4)(ii)(A), (E), and (F). It therefore appears that the Secretary did not consider that the cited provisions were only directed to the protection of buildings. See also Power Systems Div., United Technologies Corp., 81 OSAHRC 40/C13, 9 BNA OSHC 1813, 1981 CCH OSHD ¶ 25,350 (No. 79-1552, 1981) (the Secretary's proposed rulemaking does not demonstrate that portons of the NEC "are unintelligible or . . . irrelevant to occupational safety and health" and the Secretary's recognition that a revision would make the NEC provisions easier to understand does not mean that the standards are unenforceably vague as written.)

tasks they perform. The compliance officer observed these conveyors and became concerned that, if an employee became entangled in a conveyor, it might not be stopped in time to prevent injury. Each conveyor has several sets of stop-start buttons located at operator stations along the conveyor. Each conveyor also has a disconnect switch in an electrical equipment box containing an overcurrent device — a fuse — located fourteen to sixteen feet above the production floor where the conveyors are located. A ladder would be required (and would have to be brought to the area) to reach the disconnect switch. The compliance officer's concern was with the lack of ready access to the disconnect switch if the stop-start buttons should fail.

Accordingly, the Secretary charged GMC with violating sections 240-16 and 430-107 of NEC. Section 240-16 requires, in pertinent part, "Overcurrent devices shall be located where they will be: (a) Readily accessible. . . ." Section 430-107 requires, "One of the disconnecting means shall be readily accessible." In Article 100, the NEC defines "readily accessible:" "Capable of being reached quickly, for operation, renewal, or inspection, without requiring those to whom ready access is requisite to climb over or remove obstacles or to resort to portable ladders, chairs, etc."

Because GMC contends that lack of ready access did not present any hazards to the production employees and that abatement would expose them to greater hazards, the main issue between the parties has been the nature of the hazard presented by the lack of ready access to the disconnect switch located adjacent to the overcurrent device. GMC argues and the evidence shows that its disconnect switches are not designed to be opened "under load," that is, while the electrical circuit is complete.

Accordingly, GMC argues, the switches are not intended for use as a secondary disconnecting means, that is, a stop switch, in an emergency.

Examination of the NEC indicates that disconnect switches associated with overcurrent devices are normally not intended for use as stop switches. See sections 240-18, 430-101, 430-107 through 430-109, along with definitions of "disconnecting means" and "isolating switch" in Article 100. Further, a GMC electrical engineer testified that a disconnect switch's purpose is to "isolate" or "lock-out" a circuit while an electrician or millwright works on associated electrical equipment. A GMC electrician who testified on behalf of the Secretary gave similar testimony, although he also asserted that the disconnect switch must be readily accessible for use as a stop switch. Because the NEC indicates that the purpose is isolation of the circuit, see section 240-18, we conclude that lack of ready access presents a hazard to electricians and millwrights from their possible failure to isolate the circuit before working on associated equipment.

The record shows that electricians and millwrights did not have ready access to the overcurrent devices and disconnect switches. Accordingly, the record shows noncompliance with section 240-16 and, because GMC agrees that the stop-start buttons are not a "disconnecting means" under the NEC and does not argue that other disconnecting means were readily accessible, noncompliance with section 430-107 has also been shown.[12/] GMC argues that ready access to the disconnect switches

---

12/ GMC argues that the lack of ready access to the disconnect switches presented no hazard to production employees because there was little, if any, likelihood that a secondary stop switch would be needed. However,

(continued on next page)

will present a greater hazard in that there can be an arcing or explosion hazard if the production employees use the disconnect switches as secondary stop switches. However, section 501-6(b)(1) of the NEC indicates that such hazards can be eliminated if switches used to interrupt current are contained within proper enclosures. If the switch is not intended to be used to interrupt current, then the NEC suggests it should be labelled that it must not be opened under load. Compare section 501-6(b)(1) with section 430-109. Thus, compliance with the NEC should eliminate the hazards of arcing and explosion that concern GMC. Accordingly, we reject GMC's greater defense and affirm the citation. See Ed Cheff d/b/a Ed Cheff Logging, 81 OSAHRC 60/A2, 9 BNA OSHC 1883, 1981 CCH OSHD ¶ 25,431 (No. 77-2778, 1981), appeal filed, No. 81-7493 (9th Cir. July 27, 1981); Duncanson-Harrelson Co., 81 OSAHRC 28/A2, 9 BNA OSHC 1539, 1981 CCH OSHD ¶ 25,296 (No. 76-1567, 1981).

C

Judge Otto required abatement of this violation in one year. GMC takes exception to this requirement but does not argue how it is unreasonable. Abatement involves moving the overcurrent devices and disconnect switches to the production floor. Because this equipment is in an equipment box, abatement essentially involves moving the boxes. This matter of altering the electrical wiring will have to be performed on each conveyor. The record does not show how many conveyors are involved,

---

12/ (continued)

because the lack of ready access affects the electricians and millwrights rather than the production employees, we do not need to reach this argument. We note that the lack of ready access to the disconnect switches has more than a negligible relationship to the safety and health of the affected employees and therefore we could not conclude that the violation is de minimis. See Gallo Mechanical Contractors, Inc., supra note 6, and cases cited therein.

but one year appears to be sufficient time for the task involved. Accordingly, we affirm the judge's requirement of abatement in one year.

IV

Judge Otto assessed no penalty for items 1 and 13 which we affirm as nonserious violations. Having considered the factors stated in section 17(j), 29 U.S.C. § 666(i), we agree that no penalty should be assessed.

Accordingly, we deny GMC's motion to vacate the judge's decision; we affirm items 1 and 13 as nonserious violations but we assess no penalty for either item, and require abatement of item 13 in one year; we affirm item 10 as a de minimis violation for which abatement is not required. SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

RAY H. DARLING, JR.

## AMENDED DECISION AND ORDER

Judge Otto

On April 12, 1978 my decision in the above entitled case was mailed to the parties, with notice that it will be filed on May 2, 1978 and will become a final order of the Commission on June 1, 1978, unless a Commission member directs review.

The decision incorrectly located the inspected plant at Warren, Ohio, rather than Warren, Michigan. The decision is hereby corrected to conform to the record.

The citation issued November 17, 1976 contained 13 items, all of which were originally contested by respondent but at the hearing of December 13, 1977, respondent withdrew the contest of all cited items

except items 1, 10 and 13 (T 1, 2, 3). Therefore, by operation of 29 USC 659(a) the citation and the proposed assessment of penalties shall be deemed a final order of the Commission and not subject to review as to all items set forth therein, except items 1, 10 and 13 which remain in dispute. The decision omitted reference to the finality of the citation regarding items undisputed as a result of respondent's withdrawal of objection thereto.

Now therefore the following

CONCLUSIONS OF LAW

4. The citation issued November 17, 1976 and the assessments therein proposed, shall be deemed a final order of the Commission and not subject to review by any court or agency for all items identified and set forth therein, except for items 1, 10 and 13.

AMENDED ORDER

The order set forth on page 14 of the decision mailed April 12, 1978 is hereby set aside.

The citation issued November 17, 1976, as amended, is hereby affirmed. No penalty is assessed for items 1, 10 or 13, respectively.

Except as amended herein, the decision mailed April 12, 1978 remains in full force and effect. In the absence of prejudice, the May 2, 1978 filing date applies to the foregoing amended decision and order.

George W. Otto
Judge, OSHRC

Dated: May 2, 1978

| LOCAL 909, U.A.W., Chevrolet Warren Plant, | : | |
| Participant. | : | |

Appearances:

Karl C. Overman, Esq., for Complainant.

Wallet B. Rogers, Esq., for Respondent.

Jerome Eichbauer, Health and Safety Representative, UAW Local 909.

Judge Otto

This is a proceeding under the Occupational Safety and Health Act of 1970 (Act).[1/] Following inspection of respondent's Warren, Ohio plant on October 28, 1976, complainant issued one citation

1. 29 U.S.C. 651 et seq., 84 Stat. 1590.

November 17, 1976 containing 13 items of alleged nonserious violation, fixing abatement dates and proposing related penalties. Respondent duly contested the citation. Local 909 UAW, authorized representative of affected Warren plant employees, elected to participate as a party.

Hearing was held in Detroit, Michigan on December 13, 1977, at which time respondent withdrew its contest of all cited items except items 1, 10 and 13 (T 1, 2, 3).

CITATION NUMBER 1 - Item #1[2/]

Description: Frequent inspections of the cranes and lifting equipment was not performed and recorded as required. Abatement date November 24, 1976. No proposed penalty (original $30 amended to zero).

29 CFR 1910.179(j): (2) Frequent inspection. The following items shall be inspected for defects at intervals as defined in subparagraph (1)(ii) of this paragraph or as specifically indicated, including observation during operation for any defects which might appear between regular inspections. All deficiencies such as listed shall be carefully examined and determination made as to whether they constitute a safety hazard:

(i) All functional operating mechanisms for maladjustment interfering with proper operation. Daily.

(ii) Deterioration of leakage in lines, tanks, valves, drain pumps, and other parts of air or hydraulic systems. Daily.

(iii) Hooks with deformation or cracks. Visual inspection daily; monthly inspection with signed reports. For hooks with cracks or having more than 15 percent in excess of normal throat opening or more than 10°-twist from the plane of the unbent hook refer to paragraph (1)(3)(iii)(a) of this section.

2/ T 17, 18, 19, 26, 28, 29, 30, 51, 52, 53, 129, 130, 131.

(iv) Hoist chains, including end connections, for excessive wear, twist, distorted links interfering with proper function or stretch beyond manufacturer's recommendations. Visual inspection daily; monthly inspection with signed report.

(v) (Revoked).

(vi) All functional operating mechanisms for excessive wear of components.

(vii) Rope reeving for noncompliance with manufacturer's recommendations.

Crane records were three to four months behind, due to vacations and increased workload. Signed reports were three months old for hoist chains; there was no record of chain hoist inspections. No crane inspections were made in June, July, August 1976, beyond crane operators checking the upper limit switches mornings before using cranes. Maximum period with no inspection was four months.

The cited standard requires "frequent inspection," defined in 29 CFR 1910.179(j)(1)(ii)(a) as "Daily to monthly intervals." Respondent failed to comply with the requirements of subparagraphs (2)(i)(ii)(iv)(vi). Reasons contended by respondent do not justify the failure to comply with the standard. Abatement date at time of citation issuance was reasonable. A zero penalty was ultimately proposed by complainant. Considering statutory factors, no penalty is assessed.

CITATION NUMBER 1 - Item #10 3/

Description: Places of employment were not kept clean and orderly, or in a sanitary condition: In the hy-bay basement where metal scrap and deep puddles of oil covered the floor. Abatement date November 24, 1976; no proposed penalty.

29 CFR 1910.22(a)(1): All places of employment, passageways, storerooms, and service rooms shall be kept clean and orderly and in a sanitary condition.

3/ T 2, 3, 26, 27, 31-35, 53-57, 108-127, 131, 136, C-3, C-4, R-2 — R-6.

Respondent admits the floor of the hy-bay basement was not in a clean and orderly or sanitary condition, (that) the floor of the hy-bay basement was littered with metal scrap and approximately 25 to 30 percent of the floor area was oily (Request for Admissions #24 and #25, C-3 and C-4).

The cited area is under the ground level plant floor where about 12 large and 100 smaller presses are located, forming sheets of metal and continuously generating scraps which are conveyed to the basement for continued removal to the outside. The area is about 1000 feet long and 150 feet wide, with a main scrap conveyor and several feeder conveyors. There was a clean-up crew on each shift and cleaning up the basement was their sole responsibility. Oil was hosed down with steam hoses. According to respondent, there were five employees on the first and second shifts and about four on the third shift. According to the authorized employee representative, there were three employees on the first two shifts and two or three on the third shift. The compliance officer saw three or four cleaning up, and observed oil puddles one to two inches deep and scrap laying about. During the walkaround respondent's safety director saw three employees and testified about 40 to 45 percent of the basement had been cleaned, that three to five employees could clean about 50 to 100 feet in eight hours.

Scrap fell off the conveyors——chutes could jam, get holes and scrap shavings fall through overhead roller conveyor cracks.

Oil accumulated on the floor; an employee was injured June 6, 1976 when a ladder slipped on oil. Respondent has disciplined employees for refusing to work in the hy-bay basement. The employee representative testified he had to walk on a fire hose on Friday before hearing, to prevent stepping in oil.

Although the basement is not a production area, all the first floor service is distributed out of the basement. Service employees--- millwrights, electricians, pipefitters, machine repairman—work in the basement as service needs require, on a daily basis although a given employee may not be required to enter the basement every day. Employees other than members of the clean-up crews used the basement daily and were exposed to the hazards caused by the failure of respondent to keep the inspected basement reasonably clean and orderly.

The abatement date in relation to the date of citation issuance is reasonable and no penalty is assessed.

At the hearing, respondent alleged as affirmative defenses lack of employee access to the hazard and impossibility of compliance. The allegation was not timely and complainant's objection is sustained (T 1, 2, 3).[4/] Complainant has proven access and exposure; compliance was possible and readily available.

---

4/ See further discussion, item #13, pages 11, 12, infra.

CITATION NUMBER 1 - Item #13[5/]

Description:[6/] The electrical disconnects controlling the conveyors throughout the plant had the overcurrent devices located over 12 feet in the air and were not immediately accesible (sic). (29 CFR 1910.309(a) 240-16: Section 240-16, National Electric (sic) Code; as adopted by 29 CFR 1910.309(a): Section 430-107 as adopted by 29 CFR 1910.309(b).
Abatement date November 17, 1977. No penalty.

29 CFR 1910.309— National Electrical Code

(a) The requirements contained in the following articles and sections of the National Electrical Code, NFPA No. 70--1971; ANSI C1-1971 (Rev. of C1-1968) shall apply to all electrical installations and utilization equipment: ...240-16(a), (b), (c), and (d) Location in Premises (for Overcurrent Protection Devices).

(b) Every new electrical installation and all new utilization equipment installed after March 15, 1972, and every replacement, modification, or repair or rehabilitation, after March 15, 1972, of any part of any electrical installation or utilization equipment installed before March 15, 1972, shall be installed or made, and maintained, in accordance with the Provisions of the 1971 National Electrical Code, NFPA No. 70-1971; ANSI C1-1971 (Rev. of C1-1968).

29 CFR 1910.308— Subpart S—Electrical—Application

(a) General. Section 1910.309 adopts as a national consensus standard the National Electrical Code NFPA No. 70-1971; ANSI C1-1971 (Rev. of C1-1968), which is incorporated by reference in this support.

(b) Purpose of the National Electrical Code.
(1) The purpose of the National Electrical Code is the practical safeguarding of any persons and of buildings and their contents from hazards arising from the use of electricity for light, heat, power, radio, signaling, and for other purposes. The standards contained therein are occupational safety and health standards to the extent that they safeguard any person who is an employee of an employer.

---

5/ T 20-25, 36-47, 60-107, 137-199, C-1 — C-4, C-5(a)(b)(c), C-6 — C-9.

6/ Stipulation July 1, 1977, amending complainant's amended complaint.

(2) The National Electrical Code contains basic minimum provisions considered necessary for safety.

240-16. Location in Premises. Overcurrent devices shall be located where they will be:

(a) Readily accessible, except as provided in Sections 230-91 and 230-92 for service equipment and Section 364-11 for busways.

(b) Not exposed to physical damage.

(c) Not in the vicinity of easily ignitible material.

(d) Occupant to Have Ready Access. Each occupant shall have ready access to all overcurrent devices protecting the conductors supplying his occupancy...

National Electrical Code (NEC), Chapter 1. General - Article 100 - Definitions.

Accessible: (As applied to wiring methods). Capable of being removed or exposed without damaging the building structure or finish, or not permanently closed in by the structure or finish of the building. (See "Concealed" and "Exposed"). page 70-4.

Accessible: (As applied to equipment). Admitting close approach because not guarded by locked doors, elevation or other effective means. (See "Readily Accessible"). 70-4.

Readily Accessible: Capable of being reached quickly, for operation, renewal, or inspections, without requiring those to whom ready access is requisite to climb over or remove obstacles or to resort to portable ladders, chairs, etc. (See "accessible"). 70-10.

430-101. General. The provisions of Part H are intended to require disconnecting means capable of disconnecting motors and controllers from the circuit.7/

430-107. Readily Accessible. One of the disconnecting means shall be readily accessible.

7/ NEC Article 430—Motors, Motor Circuits and Controllers - Part H. Disconnecting Means.

Circuit boxes containing overcurrent protection devices and disconnect switches are located from 14 to 16 feet above floor level, at millwright drive locations for overhead monorail conveyors. Stop/start switch buttons are accessible to employees working at or adjacent to the conveyors. The millwright stations have a screenguard on the bottom and a 30" screenguard around the perimeter. To service these circuit boxes, access can be gained only by using an extension ladder and climbing over the screenguard enclosure.[8/]

The stop/start buttons are tied in series; in the event the switch shorts out or otherwise fails, there is no other means of shutting off the conveyor. Many of the conveyors have 4 to 7 buttons in series (T. 22, 74, 75). If an employee became entangled in the conveyor system and the switch buttons failed, there is no way to readily stop it.

The amended description of this item states the electrical disconnects controlling the conveyors were not "immediately" accessible, rather than "readily" accessible. The distinction, if any, is not misleading or prejudicial.

Respondent in his brief challenges the constitutionality of 29 CFR 1910.308 and .308(b)(1), that there was no exposure to a hazard, that NEC 240-16 does not apply to the facts, that sections 240-4 through 240-30 apply only to overcurrent protection for conductors, not equipment, that the stop/start button is a disconnecting means within the meaning of NEC 430-107, that there was no hazard, that compliance would be more hazardous than noncompliance.

8/ T 13, 20, 43, 67, 68, 71-74, 142-144, 155, 161, 181, 183, C-3(D), C-6(#11).

The union representative for affected employees points out that the overcurrent devices must be readily accessible and capable of being reached quickly for operation, renewal or inspection, without requiring those to whom ready access is requisite to climb over or remove obstacles or to resort to portable ladders, chairs, etc., that the purpose of overcurrent protection is not limited to conductors, as contended by respondent. He refers to NEC 240-2 and 240-3.[9/]

In evaluating this record,[10/] it is clear the cited standards do not require more than one overcurrent device. There is but one, located in the circuit box and not readily accessible. The 110 volt stop/start switch is not an overcurrent device; the circuitry contained in the box, on the source side of 440 volts, is an overcurrent device, and in performing its function interrupts and disconnects the main power source from the equipment in question. (T 160-163, 183).

---

9/ NEC 240-2. Purpose of Overcurrent Protection. Overcurrent protection for conductors and equipment is provided for the purpose of opening the electric circuit if the current reaches a value which will cause an excessive or dangerous temperature in the conductor or conductor insulation.

NEC 240-3. Protection of Equipment. Equipment shall be protected against overcurrent as specified in the references in the following list...Motors, Motor Circuits and Controllers, Article No. 430.

10/ Respondent filed a posthearing "motion to correct record," to change the testimony of its witness on page 154, line 19. Complainant objects. There is no contention the transcript does not accurately reflect what was stated by this witness, as recorded on page 154, line 19. Respondent's motion is denied.

If an employee became entangled in the conveyor and buttons were inoperative, there was no means readily available for shutting off the power (T 42). The hazard is inherent in the standard alleged. As distinguished from the general duty clause, section 654(a)(1), a cited standard presupposes the existence of a hazard when its terms are not met. Del-Cook Lumber Company, Docket #16093, February 2, 1978.

Respondent's challenge to the National Electrical Code caused by the Secretary's "failure" to interpret and declare which sections and portions apply to employees, is without merit. The NEC provisions hereinbefore set forth include worksites, and worksites contain employees.

The cited standards were violated. Complainant moved to amend the abatement date for item 13 to November 17, 1977. (T 106, 107); the citation was issued November 17, 1976. The abatement date shall be 12 months from the effective date of this decision and order. No penalty was proposed and no penalty is assessed, considering statutory factors.

Respondent is not entitled to consideration of affirmative defenses if raised for the first time at hearing, but contends the Complainant was duly apprised in the Answer to the Complaint. The Answer included as an Affirmative Defense, "Respondent states that the Complaint herein fails to state a cause of action upon which relief can be granted." This is sufficient and timely, according to respondent, by authority of Rule 12(b), Federal Rules of Civil Procedure, that it is under no obligation to disclose to complainant in any detail the specific factual bases of such defense, except in response to

properly framed, permissible discovery. The specific affirmative defenses contended at time of hearing, for both citation item #10 and #13, were not asserted prior thereto. Counsel met informally at some period prior to hearing and respondent claims there was affirmative defense specificity at that time; such occasion was not a pre-hearing conference pursuant to Commission Rule 51 and no prehearing motion for amended answer was filed, and no order upon this subject was requested or issued. Parties are encouraged to meet informally to expedite or settle proceedings, or to simplify issues and presentation of testimony, but such activity cannot serve as a substitute for or amendment of required formal pleadings. Complainant was entitled to know the specific affirmative defenses upon which respondent relied. Information for that purpose was available and could have been timely provided prior to hearing. Complainant is not required to guess as to which of many affirmative defenses respondent might elect to develop to negate a violation--- compliance prevents work, compliance impossible or not feasible, violation not foreseeable, lack of knowledge, employee fault, increased hazard, isolated occurrence, alternative protection, company rules and safety program, industry practice, quality or production affected, no or few injuries, removal from exposure, employee experience. These and many other affirmative defenses are reflected in Commission decisions.[11/]

11/ The stated affirmative defenses, if timely, would have failed to negate the effect of violation items #10 and #13.

## FINDINGS OF FACT

Item #1:

1. Crane records were 3 to 4 months late.

2. Chain hoist inspections were not recorded.

3. Adequate crane inspections were not made in June, July or August, 1976.

Item #10:

4. The hy-bay basement area contained metal scrap fallen from conveyors, with the floor containing puddles of oil.

5. Service employees used this basement and were exposed to contact with scrap and oil.

6. The floor was not in a clean and orderly or sanitary condition at time of inspection.

7. The floor conditions inspected were not unusual, nor isolated in time.

8. Clean-up crews were insufficient in number to adequately reduce the amount of scrap and oil on the floor.

9. Larger clean-up crews, adequately equipped, could materially reduce accumulation and could accelerate removal of scrap and oil.

Item #13:

10. Provisions of the NEC incorporated by reference and relevant to the cited standards were included as national consensus standards and duly promulgated by rule as occupational safety or health standards, pursuant to Section 655(a) of the Act.

11. The cited standards apply to respondent employees.

12. The applicable and cited provisions of the NEC indicate what constitutes compliant behavior, without specific or interpretive notice.

13. Section 240-16, NEC, applies to overcurrent protection for conductors and equipment.

14. The start/stop switch buttons were not disconnect devices, within the meaning of the cited standards.

15. Start/stop switch buttons were readily accessible to employees working at or adjacent to conveyors.

16. Overcurrent protection is required for the conductors and equipment comprising respondent's conveyor electrical system.

17. Circuit boxes containing overcurrent protection devices and disconnect switches were located from about 14 to 16 feet above floor level, and could be reached only by use of an extension ladder and climbing over a screenguard at millwright stations.

18. The curcuit boxes contained overcurrent or disconnect devices, within the meaning of the cited standards.

19. The inspected and cited overcurrent devices were not readily accessible.

20. Employees were exposed to hazard caused by respondent's failure to locate the overcurrent devices at levels readily accessible to employees.

21. The violation is other than serious, with no substantial probability that death or serious physical harm could result.

22. A 12-month period, commencing from the effective date of this decision and order, is a reasonable time for abatement of this violation.

## CONCLUSIONS OF LAW

1. Respondent failed to comply with occupational safety and health standard 29 CFR 1910.179(j)(2).

2. Respondent failed to comply with occupational safety and health standard 29 CFR 1910.22(a)(1).

3. Respondent failed to comply with occupational safety and health standard 29 CFR 1910.309(a) 240-16, National Electrical Code; 29 CFR 1910.309(b), Section 240-107, National Electrical Code.

## ORDER

The citation issued November 17, 1976, as amended, is hereby affirmed. No penalty is assessed.

George W. Otto
Judge, OSHRC

Dated: May 2, 1978

UNITED STATES OF AMERICA

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

1365 PEACHTREE STREET, N.E., SUITE 240

ATLANTA, GEORGIA 30309

# NOTICE OF DECISION

Secretary v. THE L. E. MYERS CO.

OSHRC Docket No. 81-560

1. Enclosed is a copy of my decision. It will be filed with the Commission on December 24, 1981, and will become the final order of the Commission on January 25, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N. W., Suite 601
   Washington, D. C. 20006

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is January 25, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

APPEARANCES:

Donald W. Hill, Esquire, Office of the Solicitor, U. S. Department of Labor, Dallas, Texas, on behalf of complainant

James S. Cheslock, Esquire, San Antonio, Texas, on behalf of respondent

## DECISION AND ORDER

BURROUGHS, Judge: Respondent, a company engaged in the construction of electrical utilities, contests an alleged serious violation of 29 C.F.R. § 1926.950(e)(1)(ii), for failure to require all members of a work crew to be knowledgeable and proficient in first aid fundamentals, and an alleged serious violation of 29 C.F.R. § 1926.952(b)(2), for failure to require an aerial lift truck to be grounded or barricaded because of work being performed near energized transmission lines. A penalty was proposed for each of the alleged violations.

The serious citation was issued to respondent on February 12, 1981. On that same date, an "other" citation, alleging a violation of 29 C.F.R. § 1904.2(a), was issued to respondent. A notice of contest was filed by respondent's corporate safety director by letter dated February 20, 1981. The letter, in pertinent part, stated as follows:

> Please be advised that in accordance with the Rules of Procedure of the Occupational Safety and Health Review Commission, THE L. E. MYERS CO. intends to contest the action initiated against it by the Department of Labor under the above referred to citation for serious violation. Our Company wishes to contest the citation and notification of proposed penalty based upon allegedly violated standards or regulations, Sections 29 CFR 1926.950(e)(1)(ii) and 29 CFR 1926.952(b)(2).

On June 24, 1981, an answer was filed by respondent's counsel. The WHEREFORE clause of the answer makes a reference to citations. Subsequent to the filing of the answer, respondent obtained different counsel. On July 23, 1981, an amended answer was filed by respondent's new counsel. Paragraph VI of the amended answer alleges that the de minimis doctrine was applicable to the alleged violation of 29 C.F.R. § 1904.2(a).

Since the notice of contest made no reference to the "other" citation or the alleged violation of 29 C.F.R. § 1904.2(a), a ruling was made at the commencement of the hearing that the Commission was without jurisdiction to hear the "other" violation of 29 C.F.R. § 1904.2(a). The answer and amended answer are insufficient to cure a defect in the notice of contest. In order for the Commission to have jurisdiction, a timely notice of contest must be filed to place the alleged violation in issue. Service Specialty, Inc., 80 OSAHRC 16/A9, 7 BNA OSHC 1770, 1979 CCH OSHD ¶ 23,928 (No. 16033, 1979). Since the notice of contest made no reference to the alleged violation of 29 C.F.R. § 1904.2(a), the Commission has no jurisdiction to review the "other" citation. Kerr-McGee Chemical Corp., 76 OSAHRC 129/C14, 4 BNA OSHC 1739, 1976-77 CCH OSHD ¶ 21,161 (No. 9890, 1976); Capital City Excavating Company, Inc., 80 OSAHRC 83/A10, 8 BNA OSHC 2008, 1980 CCH OSHD ¶ 24,734 (No. 78-4725, 1980).

## Alleged Violation of 29 C.F.R. § 1926.952(b)(2)

Respondent is engaged in the construction of electrical utilities throughout the country. While its headquarters is located in Chicago, Illinois, it is divided into

five operating divisions, one of which is the Southern Division. Divisions are divided into districts. The alleged violations occurred in the Longview District, which is part of the Southern Division.

On February 2, 1981, a work crew in the Longview District was engaged in transferring live electrical lines from an old pole to a new pole. The work was being performed at a site near Overton, Texas. An aerial bucket truck was being used to accomplish the work. There is no dispute over the fact that the truck was not grounded or barricaded. During the course of the work, the boom struck an energized transmission line and energized the truck. The foreman, Chester Young, was located at the back of the truck at the time the boom struck the transmission line and was electrocuted.

The truck was equipped with a grounding cable mounted on the front bumper. The cable was approximately 15 feet in length. For convenience purposes, the truck was backed up to the pole.[1/] As a result of the positioning of the truck, the grounding cable would not reach the pole. The terrain around the pole was level, and there was nothing to prevent the front of the truck from being driven up to the pole (Tr. 30-31). A grounding rod could also have been secured from the Overton substation located approximately five miles from the work site. There was nothing to prevent the crew from grounding or barricading the truck prior to changing the lines.

The basic facts pertaining to this issue are not in dispute. The crew was working near energized lines and failed to ground or barricade the truck. The basket and boom were insulated, but the truck was not insulated. These facts

---

1/ Gill testified that it was more convenient and efficient to work off the back of the truck (Tr. 30).

establish a violation of 29 C.F.R. § 1926.952(b)(2).[2/] Respondent defends against the violation on the grounds that the failure to ground or barricade the truck was an isolated and unpreventable act of employee misconduct on the part of Chester Young, the foreman of the crew.

An employer is generally responsible for a violation created by its supervisory employees or within their actual or constructive knowledge. An employer, however, may defend against the violation by showing that it took all necessary precautions to prevent the occurrence of the violation, including adequate supervision of its supervisory employees. Merritt Electric Co., 1981 OSAHRC _____, 9 BNA OSHC 2088, 1981 CCH OSHD ¶ 25,556 (No. 77-3772, 1981); Niagara Mohawk Power Corp., 79 OSAHRC 36/A2, 7 BNA OSHC 1447, 1979 CCH OSHD ¶ 23,670 (No. 76-2414, 1979). In order to establish the defense, the employer must show that the action of its employee represented a departure from a work rule designed to prevent the violation, that it adequately communicated the rule to its employees, and that it effectively enforced the rule when violations were discovered. Merritt Electric Co., supra; Wander Iron Works, Inc., 80 OSAHRC 40/A2, 8 BNA OSHC 1354, 1980 CCH OSHD ¶ 24,457 (No. 76-3105, 1980).

The deceased foreman, Chester Young, was responsible for the safety of his crew and ensuring that his crew complied with all applicable safety rules. It was his job to assure that the truck was grounded or barricaded as required by respondent's safety rules. Young had been employed by respondent at its Longview office for approximately thirty years. During his employment with respondent, he

---

2/ Section 1926.952(b)(2) states:

> When working near energized lines or equipment, aerial lift trucks shall be grounded or barricaded and considered as energized equipment, or the aerial lift truck shall be insulated for the work being performed.

worked as a lineman, foreman and general foreman. During the ten years prior to his death, Young had primarily worked as a foreman or general foreman. He was an experienced foreman with an excellent safety record.

On February 2, 1981, Young had four other employees in his crew: Larry Boaze, Michael Reed, J. C. Hendershott, and William Gill. All members of the crew, including Young, had been issued a pamphlet entitled "Basic Safety Rules."[3/] Page 4 of the pamphlet sets forth the following safety rule:

> 3. Aerial baskets and ladder equipment shall be grounded when near energized lines. When grounds are not permitted by the client, barricading shall be required.

Young had also received a copy of a 78-page "Safety Manual" which was issued to all foremen.[4/] Rule 204(e) on page 18 of the manual provides (Ex. G):

> When working near energized lines in aerial basket trucks and aerial ladder trucks, the trucks shall be grounded. Where grounds are not permitted by the client, barricading shall be required.

The existence of the work rule requiring grounding or barricading is sufficient to establish the first element of employee misconduct; i.e., the employer had an established work rule to cover the condition encountered by its crew.

It is equally clear that the safety rule had been communicated to all members of the crew. The pamphlet of basic safety rules had been received by all members of the crew.[5/] Young had also received the safety manual distributed to

---

3/ Respondent's general procedure is to issue the pamphlet to an employee when he is hired and secure a signed receipt from the employee acknowledging its receipt. All members of the crew had signed receipts indicating receipt of the pamphlet (Exs. B, C, D, E, F; Tr. 92-93).

4/ Young signed a receipt on October 28, 1976, indicating he had received the safety manual (Ex. H; Tr. 97-98).

5/ Gill acknowledged that he had received the pamphlet and had looked it over (Tr. 27).

supervisors which contained the same rule although it was worded in a slightly different manner. The testimony of William Gill makes it clear that the crew was aware of the requirement for grounding the truck. He testified that the crew discussed grounding the truck before commencing work on February 2, 1981, but for the sake of convenience decided against grounding (Tr. 26, 31). In addition, Michael Reed testified that safety meetings were held "about once a week" and that grounding of trucks when working near live wires had been discussed by Young at a safety meeting (Tr. 41).[6/] The truck also had danger stickers on it that warned of a possible electrocution hazard if the truck should become electrically charged (Ex. 2, 4).

The preponderance of the evidence further establishes that respondent has an adequate system for training and supervising its crews and enforcing its safety rules. Each foreman is charged with the responsibility of assuring that his crew follows established safety rules. While the foreman is entrusted with considerable responsibility, respondent's safety program is designed to adequately train him and members of his crew with respect to hazards associated with their work. In addition to the basic safety rules pamphlet distributed to all employees, including foremen, and the safety manual distributed to foremen, respondent's safety program includes the following:

> (1) A district safety committee, consisting of the safety supervisor and supervisory personnel, meets every other month to discuss safety problems and to review any accidents which have occurred in the district and division (Tr. 120).

---

6/ Gill acknowledged that tailgate safety meetings were held while he was a member of Young's crew, but he could not recall a meeting discussing the proper grounding of trucks while working around live wires (Tr. 21). He had worked for Young's crew only two or three months prior to the accident (Tr. 12). He normally did not work around live wires (Tr. 17). Most of the time he worked in Young's crew was on "cold" work (Tr. 24).

(2) Special training sessions are conducted by the safety supervisor for all foremen and general foremen at least twice each year (Tr. 121).

(3) The safety supervisor conducts "show up" safety sessions with the crews in each district approximately four times a year (Tr. 121-122).

(4) Each foreman is required to conduct a "tailgate" safety meeting with his crew each week. The meeting must be documented each week with a written report (Tr. 122-123).

(5) A monthly safety bulletin prepared by the corporate safety director is distributed to all foremen in each district. The publication is prepared separately for each district and features accidents which have occurred in the district (Ex. J; Tr. 126).

These measures are adequate to communicate safety rules and procedures to all of respondent's employees, including foremen.

Respondent also takes adequate measures to ensure that its safety program is effectively enforced. A diligent effort is made to discover and discourage violations of safety rules. The area superintendent, general foremen and safety supervisor visit the crews on a regular basis to ensure that its safety rules are being followed (Tr. 49-50, 104-105, 120). Appropriate disciplinary action has been taken where safety rules have not been followed by the foremen. Clarence Yochum, the area superintendent, testified that foremen have been fired for failing to comply with established safety rules (Tr. 105-106). Reed indicated that on three or four occasions he had observed Yochum, the safety supervisor or the general foremen, discipline employees for not following safety rules (Tr. 56). The safety program is effectively enforced.

Reed testified that there were occasions when he worked near live wires as a member of Young's crew when the truck was not grounded or barricaded (Tr. 43). No facts were offered with respect to the circumstances surrounding those

incidents, and there is no indication that he informed anyone as to possible violations of safety rules. It is also noted that 29 C.F.R. § 1926.952(b)(2) does not require lift trucks to be grounded or barricaded if the truck is insulated for the work being performed. There is no evidence to indicate the truck was not insulated for the work being performed on the occasions alluded to by Reed. The record is insufficient to conclude that safety violations did occur on those occasions.

Even if prior violations of the safety rule for grounding or barricading a truck when working near energized lines had occurred, there is no evidence to indicate that respondent had any reason to suspect Young was not implementing the company's safety rules. He had been a foreman for several years and had compiled an excellent safety record. No member of a crew supervised by Young had ever sustained an electrical injury, and no member of a crew supervised by Young had ever reported him for failure to ground or barricade a truck (Tr. 102-103). There is no evidence of a blemish on Young's safety record with the company. Respondent has met its burden in establishing that the failure to comply with the standard resulted from the unpreventable misconduct of Chester Young. The alleged violation is vacated.

Alleged Violation of 29 C.F.R. § 1926.950(e)(1)(ii)

Complainant alleges respondent violated 29 C.F.R. § 1926.950(e)(1)(ii)[7/] for failing to have all members of the crew knowledgeable and proficient in first aid

---

7/ Section 1926.950(e)(1)(ii) provides:

> The employer shall provide training or require that his employees are knowledgeable and proficient in:
>
> * * *
>
> (ii) First-aid fundamentals including resuscitation.

fundamentals including resuscitation. Respondent offers first aid training to its employees but does not require them to take such training. It argues that § 1926.950(e)(2) gives it the option of complying with the requirements of § 1926.950(e)(1) or the provisions of § 1926.50(c) and submits that it was in compliance with the provisions of § 1926.50(c).

Section 1926.950(e)(2) states:

> In lieu of paragraph (e)(1) of this section the employer may comply with the provisions of § 1926.50(c) regarding first-aid requirements.

The language of the standard clearly gives the option to the employer to elect to comply with the provisions of § 1926.50(c) with regard to first aid requirements. There are some differences in the requirements of § 1926.950(e)(1)(ii) and § 1926.50(c).[8/] Section 1926.950(e)(1)(ii) requires an employer to provide training or require that his employees are knowledgeable and proficient in first aid fundamentals, whereas § 1926.50(c) simply requires a person who has a valid certificate in first aid training to be available at the work site in the absence of an infirmary, clinic, hospital or physician that is reasonably accessible in terms of time and distance to the work site. Section 1926.950(e)(1) refers to employees, but § 1926.50(c) only requires a person trained in first aid be availabe at the work site. While § 1926.950(e)(1)(ii) may require that all employees be knowledgeable and proficient in first aid fundamentals, section 1926.50(c) imposes no such requirement.

---

8/ Section 1926.50(c) states:

> In the absence of an infirmary, clinic, hospital, or physician, that is reasonably accessible in terms of time and distance to the worksite, which is available for the treatment of injured employees, a person who has a valid certificate in first-aid training from the U. S. Bureau of Mines, the American Red Cross, or equivalent training that can be verified by documentary evidence, shall be available at the worksite to render first aid.

The issue must be decided on the basis of the requirements of § 1926.50(c) since § 1926.950(e)(2) clearly gives an employer the right to choose which standard he desires to be applicable. If an infirmary, clinic, hospital or physician is reasonably accessible in terms of time and distance to the work site, section 1926.50(c) does not require an employer to have any person available at the work site to render first aid. If medical facilities are not reasonably accessible, only one person who possesses a valid first aid certificate need be present at the work site. Respondent argues that it was in compliance with both provisions of section 1926.50(c).

A hospital was located in Overton, Texas, only 4.6 miles from the scene of the accident. Respondent submits that the hospital was "reasonably accessible" within the meaning of § 1926.50(c). In Love Box Co., 76 OSAHRC 45/D5, 4 BNA OSHC 1138, 1975-76 CCH OSHD ¶ 20,588 (No. 6286, 1975), which involved an interpretation of § 1910.151(b), the Commission adopted the decision of the Tenth Circuit in Brennan v. OSHRC and Santa Fe Transport Co., 505 F.2d 869 (10th Cir. 1974), which concluded that first aid must be administered within three minutes for serious accidents. While section 1910.151(b) uses the phrase "in near proximity to" in lieu of "reasonably accessible," the substance of the requirement is the same. The purpose of both standards is to provide for prompt medical attention for injured employees. While the time required to reach the hospital from the work site would vary according to the speed of the vehicle, traffic conditions and weather conditions, it seems unreasonable to assume that the distance of 4.6 miles could have been safely driven in three minutes even though the roads to the hospital were good and easily accessible from the work site.[9/] The hospital at Overton was not "reasonably accessible" to the work site.

---

9/ There were paved roads from Overton to the right-of-way where the crew turned off the road (Tr. 39-40). The right-of-way to the pole was fairly smooth and grassy (Tr. 40).

Since the hospital was not reasonably accessible, respondent was required to have a person who possesses a valid first aid certificate at the work site. Immediately after the accident, Hendershott[10/] and Reed administered first aid to Young, including resuscitation. While the evidence does not reflect if Hendershott held a valid certificate in first aid training, Reed did have such a certificate issued by the American Red Cross. He completed the training on March 20, 1979, and his certificate was good for three years (Ex. L; Tr. 135-137). His certificate was verified by testimony of the individual conducting the course and a letter dated March 21, 1979, to the corporate safety director stating that Reed and several other employees had completed the first aid course (Ex. L; Tr. 135-137). Since a person holding a valid certificate in first aid training from the American Red Cross was at the work site, respondent was not in violation of § 1926.50(c).

## FINDINGS OF FACT

1. Respondent, a company engaged in the construction of electrical utilities throughout the country, is divided into five divisions. The divisions are divided into districts. The Longview District is part of the Southern Division. Respondent's headquarters is located in Chicago, Illinois (Tr. 91-92).

2. On February 2, 1981, a work crew in the Longview District consisting of Chester Young, Larry Boaze, Michael Reed, J. C. Hendershott and William Gill were erecting new electrical power poles and transferring arms from one pole to

---

10/ Hendershott indicated on his receipt for the basic safety rules pamphlet issued to him on November 10, 1979, that he had training in first aid (Ex. C). The degree of his training and whether he held a valid first aid certificate were not established.

another at a work site near Overton, Texas. Young was foreman of the crew and responsible for the safety of the crew (Tr. 11-12, 19, 32, 37, 45, 87, 99, 107, 116).

3. A truck with an aerial bucket was being used to accomplish the work. There was a ground wire cable, approximately 15 feet in length, secured to the front of the truck (Ex. 3; Tr. 16, 25, 31, 50-51, 75, 100).

4. The truck was backed up to the pole on which the crew was preparing to work because the crew decided it was easier to accomplish the work with the truck in that position (Tr. 30-31, 55). Since the truck was backed up toward the pole, the grounding cable on the front of the truck was too short to reach the ground rod at the pole (Tr. 51-52).

5. There was nothing to prevent the front of the truck from being driven in toward the pole so the ground wire could have been attached to the ground rod at the pole (Tr. 25, 31, 101, 127-128). The terrain around the work site was grassy and level (Tr. 25, 40, 99-100, 127). Ground rods were available at the Overton substation and could have been obtained to ground the truck at the front (Tr. 101-102).

6. The left rear upper corner of the truck had a danger sticker on it that warned of an electrocution hazard. The sticker further warned that death or serious injury could result from contact with the vehicle if it should be electrically charged (Ex. 2; Tr. 72). The lower part of the basket boom had two danger stickers and a caution sticker on it warning of an electrocution hazard (Ex. 4; Tr. 76).

7. The aerial lift truck was not grounded or barricaded (Tr. 16, 40). The boom of the truck was 50 feet in length and was insulated. The bucket was also insulated (Tr. 100, 111, 129).

8. The members of the crew discussed grounding the truck and decided for the sake of convenience not to do it (Tr. 26, 29-30). Young was aware of the fact the work was being performed near the energized line without the truck being grounded (Tr. 30, 32, 55).

9. There was no impediment or obstruction preventing the crew from grounding the truck (Tr. 100-101).

10. Hendershott and Boaze were riding in the aerial bucket. Sometime after lunch, they came down to the ground in the bucket, picked up a new crossarm, bolt and braces, and then ascended in the bucket. As the bucket ascended, the boom of the truck struck a live electrical transmission line and energized the truck (Tr. 13-14, 33, 37-38).

11. Young was located at the back, right-hand side of the truck at the time the boom struck the transmission line (Tr. 15, 38). The truck was energized when the boom contacted the "hot" line, and Young was electrocuted (Tr. 15, 38, 99).

12. Hendershott and Reed immediately administered first aid, including cardiopulmonary resuscitation, to Young (Tr. 33, 39).

13. Reed possessed a valid first aid certificate recognized by the American Red Cross. The certificate was issued at the completion of training on March 20, 1979, and was good for three years (Ex. L; Tr. 44, 48-49, 58, 135-137).

14. Reed had received first aid training in a course sponsored by the Red Cross and conducted by Darrell Davis, the safety supervisor for respondent. The course was offered to all employees. While the company did not require the training, it was stressed to all apprentices that the company wanted them to take the training (Tr. 44, 57-58, 84, 87-88, 107).

15. The nearest hospital to the accident site was located in Overton, Texas. The hospital was located 4.6 miles from the accident site (Ex. K; Tr. 130).

16. A pamphlet entitled "Basic Safety Rules" is distributed to all employees at the time of their initial employment (Ex. A; Tr. 27-28, 44, 92). The pamphlet contains the following statement on page 4 (Ex. A; Tr. 27-28):

> Aerial baskets and ladder equipment shall be grounded when near energized lines. When grounds are not permitted by the client, barricading shall be required.

17. On February 2, 1981, Young and the other members of his crew signed receipts acknowledging that they had been issued a copy of the pamphlet (Exs. B, C, D, E, F; Tr. 93-94).

18. The receipts for the pamphlets also asked the question of whether the applicant had previously had first aid training (Ex. B-F; Tr. 94). Hendershott, whose receipt was dated November 10, 1979, and Boaze, whose receipt was dated January 16, 1980, indicated they had training in first aid. Hendershott indicated his first aid card had expired (Ex. C, F; Tr. 94-95).

19. Respondent distributes a safety manual to all of its supervisors or foremen (Ex. G; Tr. 96). Section 204(e) of the safety manual provides (Ex. G; Tr. 97):

> When working near energized lines in aerial basket trucks and aerial ladder trucks, the trucks shall be grounded. Where grounds are not permitted by the client, barricading shall be required.

20. Young signed a receipt on October 28, 1976, acknowledging a receipt of a safety manual (Ex. H; Tr. 98).

21. Respondent has a safety supervisor for its Southern Division (Tr. 119).

22. A district safety meeting consisting of supervisory personnel and the safety supervisor is held every two months. The purpose of the meeting is to discuss safety problems and to review accidents that have occurred in the district (Tr. 111-112, 120). In addition, the safety supervisor conducts training for foremen and general foremen at least twice a year (Tr. 121).

23. The safety supervisor conducts "show up" safety sessions with the crews in each district approximately four times a year (Tr. 121-122).

24. Foremen are required to hold at least one tailgate safety meeting each week. The meetings must be documented (Tr. 123). The meetings have been held by the foremen (Tr. 21, 40).

25. Young had discussed the need for grounding trucks when working near energized lines at a tailgate safety meeting (Tr. 41).

26. The area superintendent, safety supervisor and general foreman check work crews to see how they are performing their work. This check includes looking for safety violations (Tr. 49-50, 104-105, 116).

27. Two foremen and other crew members have been fired for failing to follow safety rules (Tr. 105-106). One other foreman was placed on leave without pay for two weeks for failing to follow safety rules (Tr. 106).

28. A monthly safety bulletin is prepared by the corporate safety director and distributed to all foremen in each district (Ex. J; Tr. 126).

29. Young had worked in different capacities with respondent for over thirty years. He had held the position of lineman, foreman and general foreman (Tr. 99, 110). He was working in the capacity of a foreman on February 2, 1981 (Tr. 116).

30. The area superintendent was unaware that Young had failed to ground or barricade a truck (Tr. 103). He had observed Young's work operations at least once a week but never observed a violation of any safety rules (Tr. 116-117).

31. No member of a crew supervised by Young had ever sustained an electrical injury, and no member of any crew supervised by him had ever reported him for failure to ground or barricade a truck (Tr. 102-103, 137-138).

## CONCLUSIONS OF LAW

1. Respondent, at all times material hereto, was engaged in a business affecting commerce within the meaning of section 3(5) of the Act.

2. Respondent, at all times material hereto, was subject to the requirements of the Act and the standards promulgated thereunder. The Commission has jurisdiction of the parties and of the subject matter herein.

3. On February 2, 1981, respondent was not in violation of 29 C.F.R. § 1926.950(e)(1)(ii) since it had complied with 29 C.F.R. § 1926.50(c), as permitted by 29 C.F.R. § 1926.950(e)(2), by having a person at the work site with a valid first aid training certificate approved by the American Red Cross.

4. On February 2, 1981, respondent was not in violation of 29 C.F.R. § 1926.952(b)(2) since the violation of the standard resulted from employee misconduct of Chester Young, the foreman.

## ORDER

Based upon the foregoing findings of fact and conclusions of law, it is

ORDERED: That the serious citation issued to respondent on February 12, 1981, is vacated.

Dated this 24th day of December, 1981.

| SECRETARY OF LABOR,<br>Complainant,<br>v.<br>ALLIS-CHALMERS CORPORATION,<br>Respondent. | OSHRC Docket No. 77-3285 |

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

The Secretary of Labor ("the Secretary") issued citations to Respondent, Allis-Chalmers Corporation ("Allis-Chalmers"), under the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"), alleging that Allis-Chalmers had violated section 5(a)(2) of the Act, 29 U.S.C. § 654(a)(2), by failing to comply with various safety and health standards. The question before us here is whether the Secretary has proved that Allis-Chalmers failed to comply with the standard at 29 C.F.R. § 1910.107(c)(2). 1/ Administrative Law Judge Frank B. Zinn issued a decision affirming item 33 of citation 2, which alleged noncompli-

>
> (2) Minimum separation. There shall be no open flame or spark producing equipment in any spraying area nor within 20 feet thereof, unless separated by a partition.

ance with that standard. Allis-Chalmers petitioned for review of that portion of the judge's decision, and former Commissioner Barnako directed review of the issues raised by the petition.

In its brief on review, Allis-Chalmers frames the issues as:

> 1. Whether [the Secretary] failed to carry [his] burden of proving that [Allis-Chalmers'] paint booth constituted a "spraying area" within the meaning of 29 CFR 1910.107 (a)(2).
>
> 2. Whether the Judge improperly relied on 29 CFR 1910.178 in finding [Allis-Chalmers] in violation of 29 CFR 1910.107(c)(2).

I

Allis-Chalmers manufactures generators and engines in its factory in Harvey, Illinois. There is a spray booth in which the engines and generators are spray-painted. The articles to be painted are moved into and out of the spray booth by a gasoline-powered fork lift truck. Item 33 of citation 2 alleged that Allis-Chalmers did not comply with section 1910.107(c)(2) because the fork lift is spark producing machinery and was in or within 20 feet of a "spraying area." 2/

The spraying is done every day but not constantly. The spray booth is about 15 feet high, 15 feet wide, and 20 to 25 feet deep. It has three sides and a roof. The engines and generators are put in and taken out the open end. The wall at the back end has an exhaust system with filters to control the paint

---

2/ 29 C.F.R. § 1910.107(a)(2) defines the term "spraying area." That section provides:

> § 1910.107 Spray finishing using flammable and combustible materials.
>
> (a) Definitions applicable to this section—
>
> * * *
>
> (2) Spraying area. Any area in which dangerous quantities of flammable vapors or mists, or combustible residues, dusts, or deposits are present due to the operation of spraying processes.

vapors. The fork lift is used for other jobs as well as for moving the articles to be painted, so it does not necessarily stand by to enter the spray booth as soon as the painting stops.

At the hearing before Judge Zinn, two compliance officers of the Occupational Safety and Health Administration ("OSHA") testified about the spray booth. Neither compliance officer testified as an expert on spray finishing. Compliance officer Morgan testified that he tested the flow of air through the spray booth with a velometer and that the readings signified that the filters in the booth "do not adequately withdraw the potentially combustible or flammable vapors out." He did not take any tests to determine the level of paint vapors in the atmosphere. He acknowledged that "it cannot be determined without tests" whether a dangerous atmosphere exists but stated that the air flow tests indicated the "possibility" that combustible vapors could accumulate.

The other compliance officer, Mr. Scott, testified that both the paint and the thinner being used were flammable, but he did not know the name or composition of either the paint or the thinner being used. He testified that during spray-painting the paint and solvents are atomized into a fine mist that gives off fumes and that unless the fumes are properly exhausted they can reach an explosive concentration and cause a fire or explosion.

Compliance officer Scott did not take any tests to determine the concentration of vapors in the booth. He testified that he agreed with Mr. Morgan's opinion about the need for tests, stating that it is not possible to "be certain" whether dangerous quantities of vapors are present without a test. He stated, however, that the paint residues on the walls and floor of the spray booth can be dangerous because they too give off ignitable fumes.

Mr. Scott further testified that he saw the gasoline-powered fork lift truck taking large generators into the booth to be painted, and removing them when the

painting had been completed. He stated that this fork lift had several potential sources of ignition and was not the kind of truck approved for use in a location where there may be explosive concentrations or ignitable mixtures. He did not see any spray-painting being done while the fork lift was in the spray booth.

Allis-Chalmers' manager of industrial safety and security testified it was not necessary for the concentration of vapors to reach the lower explosive limit in order to be dangerous, that he would not want the concentration to reach one fifth of the lower explosive limit. He testified that it would be necessary either to measure the gases in the atmosphere or to perform certain calculations in order to determine whether dangerous quantities of flammable vapors were present and that it was necessary to know what kinds of paint and solvent were being used.

II

Judge Zinn affirmed the item. He found that the gasoline-powered fork lift was spark producing equipment and that the fork lift was not approved for use in locations where dangerous concentrations of flammable vapors might accumulate. The judge stated that there were "problems with the ventilating system", and accepted the compliance officer's opinion that there was a dangerous concentration of vapors, stating that the opinion "makes good sense, even though no quantitative analysis was taken."

Allis-Chalmers petitioned for review on the grounds that the judge erred in finding that the spray booth constituted a spraying area under the definition at section 1910.107(a)(2), that the judge erred in relying on section 1910.178 to find that the fork lift truck was spark-producing equipment, and that portions of his summary of the evidence were incorrect.

In its brief on review, Allis-Chalmers argues that the Secretary has not proved that the booth constituted a spraying area because he did not establish

that there were dangerous quantities of flammable vapors. Allis-Chalmers argues that the testimony of the compliance officers cannot establish that dangerous quantities were present because they took no tests to establish the concentration of vapors in the air and did not even know what kind of paint was being used. Allis-Chalmers further argues that the dried paint residues within the booth are not evidence of a hazardous atmosphere.

The Secretary did not file a brief.

III

We find that the Secretary has not established that Allis-Chalmers' spray-painting booth is a "spraying area" within the meaning of section 1910.107(a)(2). The Commission has held that to prove that a cited area is a "spraying area," the Secretary must show that either dangerous quantities of flammable vapors or mists were present, or that combustible residues, dusts, or deposits were present. Ed Jackman Pontiac-Olds, Inc., 80 OSAHRC 26/D14, 8 BNA OSHC 1211, 1215, 1980 CCH OSHD ¶ 24,351, p. 29,681 (No. 76-20, 1980). We find insufficient evidence on both these points.

Even if we assume that dangerous quantities of mists or vapors were present in the booth at some time, there is no evidence that the fork lift was operated within 20 feet of the booth while that alleged condition existed. No spraying was done while the fork lift was in the booth. On the occasion observed by the compliance officer, the truck did not enter the booth for five minutes after the spraying was finished. There is nothing in the record to establish how long the allegedly dangerous quantities of fumes would continue to exist after the spraying stopped, or to indicate that the fork lift ever entered the booth immediately after spraying was completed.

We also cannot find that there were "combustible residues" in the spray booth within the meaning of section 1910.107(a)(2). When compliance officer Scott was

asked how he could have alleged that a spraying area existed where he took no tests to determine the concentration of vapors, he replied that he "could see the excess residue" in the booth. The compliance officer also testified that the residues are "an accumulation of other sprays from the spraying that had been done in the course of time" and that the paint and the solvent being sprayed were both flammable. This does not show, however, that the residues were combustible. Although Mr. Scott also testified that the residues give off flammable fumes, this goes to whether there were dangerous quantities of vapors or mists in the booth rather than to the combustibility of the residues. In sum, we find insufficient evidence that the residues were combustible. 3/

Accordingly, the judge's decision is reversed as to item 33 of citation 2; the item is vacated.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: JAN 27 1982

---

3/ Commissioner Cottine concurs in finding insufficient evidence of "combustible residues" within the meaning of section 1910.107(a)(2). Compliance Officer Scott only testified that the liquid paint residues gave off "flammable fumes". He did not identify the specific contents of the spray paint and never testified that the residues were "combustible" in either their liquid or solid states. The terms flammable and combustible define distinct classes of liquids and are not generally interchangeable. 29 C.F.R. §§ 1910.106(a)(18), (a)(19). Moreover, section 1910.107(a)(2) identifies two separate categories for the purpose of defining a spraying area: (1) flammable mists or vapors, and (2) combustible residues, dusts or deposits. With respect to the residues involved in this case there is insufficient evidence to show that they are properly considered "combustible residues" under the definition of a spraying area in section 1910.107(a)(2).

UNITED STATES OF AMERICA

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

|---|---|
| THE SECRETARY OF LABOR,<br>Complainant,<br>vs.<br>ALLIS-CHALMERS CORPORATION,<br>Respondent. | DOCKET NO. 77-3285<br>DECISION AND ORDER |

Appearances

Robert H. Brown, Esq.
U. S. Department of Labor
Office of the Solicitor
230 South Dearborn Street
Chicago, Illinois 60604

For Complainant

Bruce N. Petterson, Esq.
Corporate Employee Relations
Allis-Chalmers Corporation
Box 512
Milwaukee, Wisconsin 53201

For Respondent

Zinn, Judge

I

Statement of The Case

A. Issues. Respondent has contested three items of two citations issued to them along with other citations not in dispute that resulted from an OSHA inspection of respondent's engine factory in Harvey, Illinois. The disputed charges are, for the most part, eighteen instances of alleged machine guarding violations. There is one item alleging a paint spray area combustion hazard.

I, Statement of the Case (Cont.)

To be determined in this proceeding is whether each of the conditions described are not in compliance with the cited OSHA safety standard for general industry so as to violate the Act (The Occupational Safety and Health Act of 1970, 29 U.S.C., sec. 651 et seq.). If the violation is found, the question of an appropriate penalty must also be determined.

B. Summary of this Decision. Citation one, item 5, sub-items (a), (b), (c), (f), (g), (h), and (i) and item 10, sub-items (1), (2), (7), (8) and (9) and citation two, item 33 are affirmed as violations of the Act. Penalties are assessed for citation one, item 5, $800.00 and item 10, $800.00 and for citation two, item 33, $240.00. Abatement date for all affirmed items of citation one is 90 days after the date of filing of this decision and order. Abatement date for citation two, item 33, is immediately.

C. History of the Proceeding. OSHA officials made a lengthy inspection of respondent's plant covering a twenty day period that ended August 22, 1977. They issued the citations September 14, 1977. Respondent filed a timely notice of contest contraverting all allegations and proposed penalties. A complaint was filed carrying forward the allegations of the citations and respondent's answer followed.

I, Statement of the Case (Cont.)

Respondent by its admissions as to the interstate aspects of its business and of its status as an employer has conceded the application of the Act and of the jurisdiction of this Commission over this enforcement proceeding.

Before the hearing the parties filed a partial settlement in a written stipulation. An order was entered based upon the stipulation which eliminated a number of contested sub-items, and set out which sub-items remained for determination. At hearing, the respondent admitted that one machine cited did not meet the standard, this being a milling machine described in citation one, item 10(7), (Tr. 7). Complainant moved to drop one sub-item in dispute for lack of proof, this relating to a multiple drilling machine described in citation one, item 5(d), (Tr. 294).

II

Summary of the Evidence

Two witnesses were presented by each of the parties. Complainant called two of the OSHA compliance officers who had inspected respondent's plant. Each officer related extensive education and experience in the safety management and enforcement field. The first OSHA witness was David Morgan and the second was Robert Scott. Respondent witnesses

were Allis-Chalmers employees. Mr. Charles Swanson gave his title as manager of industrial safety and security for Allis-Chalmers Corporation. Mr. Joseph L. Wright said he worked as manager of safety and security and service for Allis-Chalmers, Engine Division. Both men told of their education and experience in industrial safety management and engineering.

When discussing testimony of a witness, for brevity, I will state only their last names. The substance of all evidence deemed material and relevant to each sub-item has been collected under the referenced sub-item.

Citation One.

Item 5(a) Unguarded Couplings in Engine Test Cells.

Scott described the engine test area which consisted of 33 testing units. There assembled engines are bolted at the fly-wheel to the drive plate and shaft of a large electric motor. They are revved up by this dynamometer and various functions of the engine are observed and noted by the test cell operator. As the motors are being tested the operator moves about within the test unit cubicle in close proximity to the exposed and revolving fly-wheel and drive plate (Tr.56). Photographs C., Ex. 7 and 8 picture one of the units. Respondent's counsel

at hearing stated that they were contesting only the penalty, thus conceding that the lack of guarding was in non-compliance with the standard cited.

The hazard as Scott described it was that the operator might be injured through body contact with or clothing being tangled in the revolving coupled plate and flywheel.

Item 5(b) Unguarded In-running Nip Points on Hole Hog Machine.

Morgan described in very little detail the device called a hole hog machine. Some pictures, C., Ex. 1 and 2 are in evidence showing exposed rollers. Respondent also conceded that this machine needed guarding and contested only the penalty proposed (Tr. 3, 14). The danger as explained by Morgan was that the operator when at the controls, was quite near the rollers and through accident or inadvertence could have clothing or a hand caught and be pulled into the machine (Tr. 16).

Item 5(c) Drilling Machine.

Morgan described this drilling machine as one with a long shanked single bit, used to drill a small hole in a crank shaft. It is pictured in C., Ex. 3. Another photograph, C., Ex. 4, shows a similar machine with a plexiglass shield. The hazard as Morgan explained, was that the operator or anyone nearby might be injured by flying fragments

if the drill bit were to break (Tr. 19). The operator worked within one or two feet of the drill according to Morgan (Tr. 16). Swanson said the operator was not usually within proximity of the drill (Tr. 220). He said that the controls were five feet away. Swanson said the machine involved had torque monitoring sensors that reduced the hazard of drill breakage. He said that if breakage occurred, it was usually inside the work (Tr. 218). It was his opinion that the rotating head did not present a hazard (Tr. 220-221).

Item 5(e) Multiple Drilling Machine.

There were several multiple drilling machines. Scott explained that these were devices with a gang of drill bits from 24 to 36 in number. The operator loaded the part, then turned on the machine, which then operated automatically to bore holes in jig mounted engine parts to a required depth, then withdrew and stopped itself. The operator removed the piece being drilled, replaced it with another, again started the machine, then went on to other tasks. One man operated as many as four machines.

II, Summary of the Evidence (Cont.)

A photograph of the machine cited in item 5(e) is R., Ex. 9. In discussing this sub-item, Scott said that another photo, C., Ex. 9, was of a typical multiple drill, but he did not identify the drill pictured as any particular machine cited (Tr. 70).

Item 5(f) Multiple Drilling Machine.

C., Ex. 10, was said by Scott to be a photo of the drill described in this citation (Tr. 75). Another photo in evidence, R., Ex. 3, is also indicated as being of this same machine. The drill bits are unguarded above the drilling table. Swanson said the controls were two or three feet from the drills. He said that these drills are lowered through the drill table shown which is a template, into the part being drilled below the table (Tr. 223).

Item 5(g) Multiple Drilling Machine.

Photograph C., Ex. 12, pictures the drilling machine covered by this sub-item. Another picture of this machine is R., Ex. 4. Scott said the operator pictured in C., Ex. 12, was within a foot of the revolving drills.

II, Summary of the Evidence (Cont.)

Swanson said no guarding was needed as the drills were in essence guarded by the fixture into which they were placed as they went into the piece being drilled (Tr. 224).

Item 5(h) and (i) Band Saws.

Scott described these devices as horizontally mounted band saws used for cutting bar stock. R., Ex. 1 - 2, and C., Ex. 15 and 16 show the machines. On either side of the guides that hold the moving blade in place at the point where the blade contacts the stock to be cut, there is a span of several inches of bare blade. This is outside the point where the blade passes into the housing that covers the rest of the continuous blade and the wheels on which it runs. This stretch of bare blade is what Scott described as posing a hazard and requiring guarding. An adjustable guard that telescoped to allow adjustment for varying the opening to accommodate different widths of stock was described by Scott as being common in industry (Tr. 93, 94). Scott pointed out that the National Safety Council Accident Prevention Manual for Industrial Operations, 7th ed. (C., Ex. 13), at pages 837-838 suggested a form of guarding for band saws Swanson said that the operators did not get near the moving

band saw. The controls were two and one-half feet away from the blade. The saw moved down automatically after the stock had been emplaced and started the cutting. He did not believe the blades needed any further guarding (Tr. 227). Swanson said he had seen some such saws guarded and many that were not.

Item 10(1) Milling Machine.

Eight milling machines are involved in this proceeding, each is claimed to lack guarding of their point of operation. In general, these are electric motor driven devices that have cutting heads of varying sizes which are used to mill or cut away metal from castings and forgings to achieve desired finished dimensions. The cutting heads resemble large toothed gears with hardened metal blades mounted in each tooth. They rotate at high speed against the piece being cut, which passes the cutting head or is passed by it. Scott said that in his opinion the rotating heads were a hazard to the operator as the exposed cutters could injure them if any contact was made by their bodies or if their clothing should be caught and entangled (Tr. 108).

Swanson identified and respondent introduced in evidence as R., Ex. 16, portions of a pamphlet entitled Machine Guarding-Assessment of Need, a NIOSH publication. He quoted from page 53 a statement under the paragraph title "Hazards" which reads, "The milling machine is rarely guarded at the point of operation."

Scott referred to the National Safety Council pamphlet (C., Ex. 13), and noted what it said on pages 835 and 836 about milling machine safety practices. It also described and illustrated ways to guard milling heads. Morgan said he saw a workman within one or two feet of the operating head of this machine (Tr. 25). The machine in this item is pictured by C., Ex. 5, and by R., Ex. 7. Scott said generally speaking about milling machines that the operators are within one foot of the milling heads when preparing them for operation (Tr. 97). All the heads needed guarding in his opinion. Swanson said that as to this particular machine, that the operator would not be closer than within two feet of the cutter head. He did not think the head needed guarding (Tr. 203 - 204).

Item 10(2) Milling Machine.

Morgan said the worker operating this machine was within one to two feet of the operating head (Tr. 25). This is pictured in C., Ex. 6, and shows three unprotected cutting heads. Swanson said the machine was not around the plant any longer. He could not say whether it needed guarding or not (Tr. 204).

Item 10(3) Milling Machine.

Respondent provided a photo of the machine covered by this sub-item (R., Ex. 13). It shows a single milling head projecting laterally. Complainant's witness, Scott,

identified ten photographs of different milling machines, C., Ex. 17 thru 26. None of these pictures seemed to be of the same machine cited in this sub-item. No particular testimony was given to describe the machine covered by the sub-item. Scott gave a general statement that all the milling machines cited needed guarding because the operators had to get within one or two feet of them (Tr. 97, 98).

Item 10(4) Milling Machine.

Respondent provided a picture of the machine covered by this sub-item (R., Ex. 12). None of the complainant's photos seemed to be of the same machine. Scott did not describe any particular machine as being the one referred to in this sub-item. Swanson said the controls on this machine were two and one-half to three feet away from the cutting head. He said that the operator had no reason to get near the cutting head. He did not believe it needed a guard and that there was no hazard (Tr. 206, 207).

Item 10(5) Milling Machine.

No pictures or description of this particular machine were offered by complainant. Respondent had no picture and Swanson had no specific recollection of the machine. On this there is only Scott's testimony that all milling machines cited had the same problems and hazards.

II, Summary of the Evidence (Cont.)

Item 10(6) Milling Machine

R., Ex. 6, was identified as being a picture of the machine cited in this sub-item. Complainant had no picture identified as being of the cited machine. Scott did not describe this machine individually nor did Swanson.

Item 10(7) Milling Machine.

The machine is shown in the photo, C., Ex. 19. The operator is pictured and the unprotected cutting head is quite near his hand. Respondent's man Swanson said the machine needed guarding (Tr. 211).

Item 10(8) Milling Machine.

Respondent supplied a picture of this machine (R., Ex. 5). It shows two cutting heads with one near the control panel. Swanson said that the machine had four cutting heads. He felt that there was a need for some control mechanism as he described it between the control panel and the nearest cutting head. He believed the remaining heads were no hazard (Tr. 212). Complainant had no pictures and presented no testimony that described the particular machine cited in this sub-item,

Item 10(9) Oil Seal Press.

Complainant supplied a picture of this machine (C., Ex. 27). It shows an open press with the ram up and

the die below, with no barrier guarding to prevent access to the point of operation. Scott described the operation of the device as being like a punch press. The control was a single pneumatic valve on top of the press. He said both of the operator's hands were free after actuating the press and could have access to the point of operation (Tr. 115-117).

Citation 2, Item 33, Paint Spray Area, Spark Source.

Complainant supplied four pictures that relate to this sub-item. C., Ex. 28 and 29 show the fork-lift truck in operation. The first picture is of the truck and operator moving a generator. Scott said this was within the spray booth (Tr. 121). He described the booth as an open commercial spray booth about fifteen feet wide and 20 to 25 feet deep and with a roof but no front. Swanson said the booth was like a garage without a door, having three sides and a roof (Tr. 227). The back wall had an exhaust system. Morgan had tested the exhaust system air flow by measuring it and obtaining readings varying from 60 to 120 feet per minute. He said a flow of under 100 linear feet per minute would allow combustible vapor to accumulate in the booth (Tr. 43, 44). Wright said that when Morgan told him of the velometer readings at the paint spray booth, that when asked, replied that the readings were satisfactory (Tr. 287).

II, Summary of the Evidence (Cont.)

Morgan said no tests of the vapor content of the air was made. Scott confirmed this (Tr. 156). Scott said he made no temperature tests. He saw the open paint and solvent containers and the spray apparatus as pictured in C., Ex. 30, 31. Scott agreed with Morgan that to verify the lower limits of the explosive character of the vapors they would have to have done some testing (Tr. 157). He based his findings of dangerous quantities of flammable vapors being present on his observation of the paint and materials and the spray painting being done (Tr. 137). He explained that the fork-lift was a gasoline motor driven machine with spark producing functions such as spark plugs, distributor, spark coil, generator and manifold, all being ignition sources.

Complainant put into evidence as C., Ex. 32, an abstract of the OSHA regulation, 1910.178 relating to powered industrial trucks. Scott explained that certain types of trucks could properly be used in flammable atmospheres. He discussed the tables N-1 in the standard, giving the different ratings for trucks indicating that the truck respondent was cited for did not meet ordinary and acceptable classification for use in Class I locations. These locations are described as places where flammable gases or vapors are present at levels sufficient to produce explosive or ignitible mixtures (Tr. 134, 135).

II, Summary of the Evidence (Cont.)

Penalties.

Scott explained how the proposed penalties in the citations had been calculated. He said he followed the OSHA field operations manual, considering gravity of the violation cited, the employer's size, good faith and history. Because of the great number of items unguarded and employee exposure, he rated the gravity as high. He gave no credit for size as respondent was a large employer. He gave no credit for good faith on the basis of the employer being a large one and there being a multiplicity of violations (Tr. 150). He gave credit for history at full value for lack of a previous record of OSHA violations at the particular factory. Using $1,000.00 as a starting point for each item, Nos. 5 and 10, he adjusted by ten percent as an allowance for history. The net penalty proposed was $900.00 for each item of the citation. For citation No. 2, item 33, Scott, without going into the details said he followed the same reasoning and came up with a net proposed penalty, $270.00 (Tr. 144).

Respondent's man, Wright, told of the general efforts made at the plant to enforce OSHA requirements. He mentioned safety awards and citations the company had received in recognition of long accident free periods and low loss experience.

III

Opinion

The OSHA standards with which this proceeding is concerned are a portion of the safety standards for general industry. The group of nine sub-items under citation one, item 5, are cited as instances of non-compliance with the standard which reads:

> "1910.212 - GENERAL REQUIREMENTS FOR ALL MACHINES
>
> (a) Machine Guarding.
>
> (1) Types of guarding. One or more methods of machine guarding shall be provided to protect the operator and other employees in the machine area from hazards such as those created by point of operation, ingoing nip points, rotating parts, flying chips and sparks. Examples of guarding methods are barrier guards, two-hand tripping devices, electronic safety devices, etc."

The group of nine sub-items under citation one, item 10, are cited as instances of non-compliance coming under other portions of the same standard which read:

> "(3) Point of Operation Guarding.
>
> (i) Point of operation is the area on a machine where the work is actually performed unon the material being processed.
>
> (ii) The point of operation of machines whose operation exposes an employee to injury, shall be guarded. The guarding device shall be in conformity with any appropriate standard therefor, or, in the absence of applicable specific standards,

shall be so designed and constructed as to prevent the operator from having any part of his body in the danger zone during the operating cycle.

(iii) * * * * *

(iv) The following are some of the machines which usually require point of operation guarding:

(a) * * * * *
(b) * * * * *
(c) * * * * *
(d) Power presses.
(e) Milling machines.
(f) Power saws."

Citation two, item 33 is cited as an instance of non-compliance with a portion of the standard dealing with combustibles in the process of spray finishing. Parts of it read:

"1910.107 - SPRAY FINISHING USING FLAMMABLE AND COMBUSTIBLE MATERIALS

(a) Definitions applicable to this section.

(1) * * * * *

(2) Spraying Area. Any area in which dangerous quanities of flammable vapors or mists, or combustible residues, dusts, or deposits are present due to the operation of spraying processes.

(3) Spray Booth. A power-ventilated structure provided to enclose or accommodate a spraying operation to confine and limit the escape of spray, vapor and residue, and to safely conduct or direct them to an exhaust system.

(b) * * * * *

(c) Electrical and other sources of ignition.

(1) * * * * *

(2) Minimum separation. There shall be no open flame or spark producing equipment in any spraying area nor within 20 feet thereof, unless separated by a partition."

* * * * *

(d) Ventilation

(1) * * * * *

(2) General. All spraying areas shall be provided with mechanical ventilation adequate to remove flammable vapors, mists or powders to a safe location and to confine and control combustible residues so that life is not endangered. * *"

I will discuss each of the sub-items in the same order as they are set out in part II, of this decision, the Summary of the Evidence.

Citation One.

Item 5(a) Unguarded Coupling in the Engine Test Cells.

The lack of guarding and the need for it is admitted. Each of the 33 units was in non-compliance with the cited standard. The hazard seems great because of the number of possible sources of injury. Many engines passed through this testing process with each operation posing the danger

of injury. This is a violation of the Act and this sub-item of citation one is to be affirmed.

Item 4(b) Unguarded In-running Nip Points, Hole Hog Machine.

The respondent admitted this situation to be in non-compliance. So little information was presented of employee exposure to the rollers or as to the nature of the work done at this machine as to make weighing the gravity of the violation a difficult task. The violation is found however, and the sub-item is to be affirmed.

Item 5(c) Drilling Machine.

The rotating bit, shank and drill chuck are all sources of danger if there is a hazard of contact by a worker. A breaking drill bit and flying pieces was mentioned as another source. These are such things as need to be guarded under the standard cited. The fact that the drill is protected from breaking by a torque sensor and that the operator is not usually close to the machine after the operation is begun, reduce the likelihood of injury, but do not eliminate it. The lack of a guard is a failure to comply and is a violation of the Act. This sub-item is to be affirmed.

Item 5(d) Multiple Drilling Machine.

This citation sub-item is to be vacated on motion of complainant.

III, Opinion (Cont.)

Item 5(e) Multiple Drilling Machine.

No description of this machine or its functioning was supplied by complainant's witnesses. This sub-item is to be vacated.

Item 5(f) Multiple Drilling Machine.

This gang drill has exposed bits and heads that rotate. The operator can be near the machine as it runs its cycle and would have some access to the revolving drills. Since the drills pass through a template and into the piece being drilled below the table, the likelihood of such contact is not high. As this condition is not in compliance with the standard and is a violation the sub-item should be affirmed.

Item 5(g) Multiple Drilling Machine

This machine is a group of drills mounted horizontally, with the operator working quite near them when at the controls. The unguarded drills are within reach and as such are not in compliance and do pose a hazard. This sub-item should be affirmed.

Item 5(h) and (i) Band Saws.

The portion of open blade on either side of the point of operation of these band saws is a hazard. The controls are far enough away that if the operator were to

go no closer than the control panel then the risk factor would be low. However, the point where the stock is located makes it likely that the operator might need to perform some task closer to the exposed and moving blades. The testimony and literature in evidence suggest some guarding is customary and practical. The lack of guarding is not in compliance with the standard and is a violation. The sub-items relating to the saws should be affirmed.

Item 10(1) Milling Machine.

The exposed cutting head is unguarded. The operator could come into contact with the moving head as nothing prevents this from happening. This condition does not comply with the cited standard. This is a violation and the sub-item should be affirmed.

Item 10(2) Milling Machine.

The unprotected heads are a hazard on this three headed unit. Neither location nor barriers afford any preventative to a worker approaching the moving heads. The sub-item should be affirmed as the condition does not meet the standard and is in violation.

Item 10(3) Milling Machine.

Inadequate information was given on this machine for any determination to be made. The OSHA compliance officer's general conclusion is not sufficient to make a

III, Opinion (Cont.)

finding upon. The picture, R., Ex. 13, shows the unprotected mill head, but that alone is not enough. This sub-item is to be vacated.

Item 10(4) Milling Machine.

Here again there is only a picture supplied by respondent, R., Ex. 12, with testimony by Mr. Swanson that he did not believe the machine needed guarding, for the controls were over two feet from the head. A lack of information for a finding requires that this sub-item be vacated.

Item 10(5) Milling Machine.

This machine was not specifically discussed by either complainant's or respondent's witnesses. No pictures were supplied of it by either party. This sub-item is to be vacated.

Item 10(6( Milling Machine.

Respondent supplied a photo, R., Ex. 6, but neither side gave any particular information about this machine. The sub-item must be vacated for lack of evidence.

Item 10(7) Milling Machine.

Respondent conceded this machine needed guarding. The testimony indicates there is a hazard. The sub-item is to be affirmed.

III, Opinion (Cont.)

Item 10(8) Milling Machine.

Respondent's witness, Swanson, conceded that there was a need for protecting the nearer of the four cutting heads on the machine. This unit is pictured in R., Ex. 5. There is a hazard so there is a need for guarding. The condition does not meet the standard cited and is a violation. This sub-item is to be affirmed.

Item 10(9) Oil Seal Press.

This unit is a power press and there is nothing to keep the operator's hands away from the point of operation. This falls short of the guarding standard cited. The condition is a violation and the sub-item is to be affirmed.

Citation No. 2, Item 33, Paint Spray Area, Spark Source.

The fork-lift truck being a gasoline powered unit is one other than the kind approved for use in locations where volatile flammable liquids are handled and in which concentrations of gases or vapors are normally kept from being hazardous by ventilation, but which might become hazardous if the ventilation system did not operate normally. This is founded upon the guidelines of the OSHA standard for powered industrial trucks, 1910.178 which was put in evidence by complainant (C., Ex. 32), and of which official notice is taken. This item of the citation is claimed to

be a failure to comply with the standard 1910.107(c)(2) prohibiting any spark producing equipment within twenty feet of a spraying area. The gasoline engine on the truck is a spark producing item of equipment. I find that because of the problems with the ventilating system, and the fact that spraying was going on from time to time in the booth with the presence of the open containers of paint and solvent, that there were circumstances from which Mr. Swanson's opinion of the atmosphere in the respondent's spray booth being a hazardous collection of dangerous and flammable mists and gases makes good sense, even though no quantitative analysis was taken. The item should be affirmed.

Respondent would have the machine guarding items of the citation dismissed as de minimis matters on a theory of little showing of actual exposure and no showing of a record of injury. Van Raalte C., Inc., 76 OSAHRC 48/B8, 4 BNA OSHC 1151, 1975-76 CCH OSHD 18,067,20,633; The Gold-Mersereau Company, Inc., 76 OSAHRC 88/B6, 4 BNA OSHC 1498, 1975-76 CCH OSHD, 19,474, 20,916. Respondent contends the standard cited relating to point of operation guarding does not apply to milling machines. The basis for this argument is that in most milling machines the point where

the milling or cutting takes place on the metal being cut is in some covered or interior point remote from the operator. That does not make the standard inapplicable in the instances found to be in violation here. In each item affirmed while the milling head alone is a hazard, the point of contact with the part is also an accessible hazard presenting some danger to the operator. The facts do not quite match as there is employee approach to some if not all of the machines cited at the Allis-Chalmer's plant. There was no showing of any lack of injury experience or to the contrary that there had been injuries. The lack of compliance provides a presumption of hazard. Vecco Concrete Construction, Inc., 77 OSAHRC 183/A2, 5BNA OSHC 1960, 1977-78 CCH OSHD para. 22,247. For the de minimis treatment to be afforded the non-compliance, and it not adjudged a violation, there must be a showing that the safety of respondent's employees has not been diminished by the condition. Clifford B. Hannay & Sons, Inc., 78 OSAHRC 12/A2, 6 BNA OSHC 1336, 1977-78 CCH OSHD par. 20,812 22,525.

With regard to the last item having to do with the spray painting area, respondent contends the complainant failed to establish that the atmosphere was such as to contain dangerous quantities of flammable vapors. The

decision in Bethlehem Fabricators, Inc., 76 OSAHRC 62/C2, 4 BNA OSHC 1289, 1976-77 CCH OSHD par. 18,683, 20,782 is cited as making such proof a predicate for a determination of a violation under the cited standard. The situation here with the fork-lift truck was somewhat different than in the Bethelem Fabricators. In any spraying operation it is reasonable to expect the atmospheric concentrations will vary from moment to moment. What the standards address themselves to is what the hazard might be as well as what it is. This is illustrated by reading a portion of the standard on powered industrial trucks which was put into evidence as C., Ex. 32. The portions of the standard read:

> "1910.178 - POWERED INDUSTRIAL TRUCKS
>
> (a) General Requirements.
>
> (1) This section contains safety requirements relating to fire protection, design, maintenance, and use of fork trucks,. . . powered by electric motors or internal combustion engines.
>
> * * * * * * *
>
> (b) Designations.
>
> For the purpose of this standard there are eleven different designations of industrial trucks or tractors as follows: D, DS, DY, E, ES, EE, EX, G, GS, LP and LPS.
>
> (1) * * * * *
>
> (2) * * * * *

III, Opinion (Cont.)

(3) The DY designated units are diesel powered units that are provided with additional safeguards to the exhuast, fuel and electrical systems. * * * *

(4) * * * * * *

(5) * * * * * *

(6) The EE designated units are electrically powered units * * * *

(7) The EX designated units are electrically powered units * * * *

(8) The G designated units are gasoline powered units having minimum acceptable safeguards against inherent fire hazards.

(c) Designated Locations.

(1) * * * * * *

(2) * * * * * *

(i) * * * * * *

(ii) * * * * * *

(iii) * * * * * *

(iv) Powered-operated industrial trucks designated as DY, EE or EX may be used in locations where volatile flammable liquids or flammable gasses are handled, processed or used * * * * *; also in locations in which hazardous concentrations of gasses or vapors are normally prevented by positive mechanical ventiliation but which might become hazardous through failure or abnormal operation of the ventilating equipment; * * * * * *"

III, Opinion (Cont.)

The lift truck was described as being one with a gasoline powered engine. This seems to make of it a designation G truck, not acceptable for use in a designated location described in the quoted portion of the standard. The paint spray booth seems to meet the description of a location described in (iv) as the exhaust system if working is intended to keep the concentrations of flammables from becoming hazardous as described in 1910.107(d)(2).

Penalties.

The usual matters that are to be weighed in fixing penalties prescribed by sec. 666(1) of the Act, size of employer, gravity of violation, good faith of employer, history of compliance were all discussed by Mr. Swanson in explaining the proposed penalties. The number of employees was not mentioned but the size of the plant indicates Allis-Chalmers is a large employer entitled to no special credit under the OSHA penalty guidelines which seem fair and reasonable in this aspect. The gravity of the violation as it relates to a likelihood of injury to employees seems high when the total number of machines and instances of exposure involved is counted. Each of these were assembly-line type operations with repetitive operations carried on at each work stand. Respondent's good faith was questioned

on the basis of the large number of items found in violation, although full credit for history for a favorable record of a lack of OSHA citations at the plant was allowed. This logic is not acceptable, and I would give credit for good faith for lack of any demonstration of bad faith. If the increments of credit in the OSHA Field Operations Manual method for figuring proposed penalties are fairly given, the formulary is fair and reasonable. The OSHA pattern for calculating penalties is not a constraint upon this Commission or its Judges. The complainant's proposed penalties are merely advisory. Brennan v. OSHRC and Interstate Glass Company, 487 F2d 438, 441-2 (8th Cir. 1973); Long Manufacturing Company, N.C., Inc., 554 F 2d 903, 908 (8th Cir. 1977). Borrowing the formula however, and modifying the proposed penalties as the facts warrant it would tend to fairness and even-handed assessments and is preferred to following only the broader parameters of the Act's advice 29 U.S.C. 666(i). I believe that modifying the proposed penalties to give the ten percent good faith credit will be a proper adjustment, and will result in a fair penalty. Assessments of $800.00 on each item of citation one, and $240.00 on citation two are reasonable and should encourage future compliance with the Act by Respondent.

Abatement.

Abatement dates for all items in issue as proposed by complainant have all been passed. Respondent should be given a reasonable time for resolving any hazards that are found to require abatement by this proceeding. An abatement date of ninety days for all items needing mechanical guarding should be sufficient time. The item as to the spray painting area is more easily corrected and is of a higher gravity and immediate abatement should be required.

IV

Findings of Fact

To state formally the determinations made of the disputed factual issues, these findings of fact are made:

1. Item 5(a). The unguarded couplings in the engine test cells were a hazard of high gravity to a large number of respondent's employees.

2. Item 5(b). The unguarded in-running nip points on the hole hog machine was a hazard to respondent's employees.

3. Item 5(c). The drilling machine was unguarded; employees were exposed to hazard of injury. The likelihood of injury from the hazard is of low probability.

4. Item 5(e). The drilling machine was not identified or described adequately to support a finding.

IV, Findings of Fact (Cont.)

5. Item 5(f). This multiple drill is unguarded. Employees are exposed to a hazard of injury. The likelihood of injury is of low probability.

6. Item 5(g). This multiple drilling machine is unguarded. The operator is exposed to a hazard of injury. The likelihood of injury is of low probability.

7. Item 5(h) and (i). The exposed band saws are a hazard to the operator. The likelihood of injury is of low probability.

8. Item 10(1). This milling machine is unguarded. The operator is exposed to the hazard of injury. The likelihood of injury is of low probability.

9. Item 10(2). This three headed milling machine is unguarded. The operator is exposed to the hazard they present. The probability of injury is low.

10. Item 10(3). This milling machine was unguarded but no hazard is shown.

11. Item 10(4). This milling machine was unguarded. There is no hazard of injury to employees presented by the milling head.

12. Item 10(5). No finding of hazard can be made.

13. Item 10(6). This milling machine was unguarded but no hazard shown.

14. Item 10(7). This milling machine is unguarded and hazardous. The likelihood of injury is of low probability.

IV, Findings of Fact (Cont.)

15. Item 10(8). This milling machine has several unguarded cutting heads. They present a hazard to employees. The likelihood of injury is of moderate probability.

16. Item 10(9). The oil seal fabricating press is unguarded. The operator is exposed to the hazard of injury. The likelihood of injury is of moderate probability.

17. Citation 2, Item 33. The paint spray booth is a paint spray area where volatile flammable liquids are used and where hazardous concentrations of gases or vapors are normally prevented by positive mechanical ventilation.

18. Citation 2, Item 33. The gasoline powered fork-lift truck is a spark source which was operated in the paint spray booth in the presence of flammable materials. This condition presented a hazard of injury to employees. The likelihood of such injury is of moderate probability.

19. Respondent, Allis-Chalmers, is a large employer.

20. The machine guarding violations except item 5(a) were mostly of low or moderate gravity, but in the aggregate are serious in nature.

21. The spray area violation is of moderate gravity and is serious in nature.

IV, Findings of Fact (Cont.)

22. Respondent has demonstrated good faith in its program of trying to improve safety performance through self-inspection, and in abatement of conditions noted.

23. Respondent has a favorable history of compliance with the Act, at its Harvey, Illinois plant.

24. A reasonable penalty for the violations found should be assessed and the sum of $800.00 for item 5 and $800.00 for item 10 of citation one and $240.00 for item 33, citation two, would be appropriate.

25. Abatement of all conditions found violative under citation one can be accomplished reasonably within ninety days of the entry date of this decision. Abatement of the condition found violative under citation two can be accomplished immediately.

V

Conclusions of Law

To state formally the conclusions reached in determination of disputed issues of law, the following is stated:

1. Items 5(a), (b), (c), (f), (g), (h), and (i). The conditions as found with regard to each of these sub-items do not comply with the guarding requirements of the

standard cited, 1910.212(a), and are in violation of the special duty clause, section 654(a)(2) of the Act.

2. Item 5(d) and (e). These sub-items are not in violation for lack of compliance with the cited standard.

3. Item 10(1), (2), (7), (8) and (9). The conditions as found with regard to each of these sub-items do not comply with the guarding requirements of the standard cited, 1910.212(3)(ii), and are in violation of the special duty clause, section 654(a)(2) of the Act.

4. Item 10(3), (4), (5) and (6). These sub-items are not in violation for lack of compliance with the cited standard.

5. Citation one, item 5(a), (b), (c), (g), (h) and (i) and item 10(1), (2), (7), (8) and (9), should be affirmed.

6. Citation one, item 5(d) and (e) and item 10(3), (4), (5) and (6) should be vacated.

7. Citation two, item 33 should be affirmed.

8. A reasonable penalty should be assessed on each citation affirmed.

9. Abatement should be ordered accomplished within a reasonable time on the violations of citation one and immediately on the violation of citation two.

VI

ORDER

Citation one, item 5, sub-items (a), (b), (c), (f), (g), (h) and (i) and item 10, sub-items (1), (2), (7), (8) and (9) and citation two, item 33 are affirmed.

2. Citation one, item 5, sub-items (d) and (e) and item 10, sub-items (3), (4), (5) and (6) are vacated.

3. A penalty of $1,840.00 is assessed.

4. Abatement of the conditions described in the portions of citation one affirmed are to be accomplished by July 12, 1978. Abatement of the condition described in the portion of citation two affirmed is to be accomplished immediately.

# NOTICE OF DECISION

Secretary v. Mica Construction Company

OSHRC Docket No. 81-218

1. Enclosed is a copy of my decision. It will be filed with the Commission on December 28, 1981, and will become the final order of the Commission on January 27, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N. W., Suite 601
   Washington, D. C. 20006

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is January 27, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

## DECISION AND ORDER

APPEARANCES:

Jordana W. Wilson, Esquire
Office of the Solicitor
U. S. Department of Labor
555 Griffin Square Building
Griffin and Young Streets
Dallas, Texas 75202
On behalf of the Complainant

Michael R. Jones, Esquire
Miller, Jones & Goldman
A Professional Association
Post Office Box 1440
Hot Springs, Arkansas 71901
On behalf of the Respondent

BRADY, Judge: This proceeding is brought pursuant to section 10 of the Occupational Safety and Health Act of 1970 (Act) to contest a citation and proposed penalty issued by the Secretary of Labor (Secretary) pursuant to section 9(a) of the Act.

The citation, which alleges willful, or in the alternative repeated violations, was issued respondent following an inspection of its work site where it was installing a ten-inch sewer pipeline in a trench.

Respondent is charged with violating the specific requirements of the trenching standards at 29 C.F.R. § 1926.652 at the work site on Terry Lane between Pringle and Comp streets, Hot Springs, Arkansas. There is no dispute that the trench collapsed on December 15, 1980, and at that time, it measured approximately 13 feet deep and 3 feet wide. Also, the evidence is not in conflict that employees were working in the trench, and the sides were neither shored or sloped nor were other means of protection provided.

ALLEGED VIOLATION OF 29 C.F.R. § 1926.652(a)

The standard states in pertinent part as follows:

> (a) Banks more than 5 feet high shall be shored, laid back to a stable slope, or some other equivalent means of protection shall be provided where employees may be exposed to moving ground or cave-ins. Refer to Table P-1 as a guide in sloping of banks.

The alleged violation is described in the complaint as:

> The banks of a trench more than five feet high were not shored, layed back to a stable slope, nor was some other equivalent means of protection provided, where employees might have been exposed to moving ground or cave-ins.

The central issue presented is whether the standard allegedly violated applies to the facts in this case. The applicable definition under 29 C.F.R. § 1926.653, sets forth, "(c) 'Bank' - a mass of soil rising above a digging level." Although the complaint states that the "banks" of the trench in question were not properly shored or sloped, there is no evidence regarding "banks" as defined in the Secretary's own regulations. The thrust of the Secretary's case pertains to the

vertical sides of the trench in question and there was no evidence presented with reference to soil arising above the digging level. The standards under 29 C.F.R. § 1926.652, which contain specific trenching requirements, make a clear distinction between "banks" and "sides" of trenches in providing for the safety of employees.

The standard has, therefore, not been violated as alleged.

ALLEGED WILLFUL VIOLATION OF 29 C.F.R. § 1926.652(c)

The standard provides in pertinent part as follows:

> (c) Sides of trenches in hard or compact soil, including embankments, shall be shored or otherwise supported when the trench is more than 5 feet in depth and 8 feet or more in length. In lieu of shoring, the sides of the trench above the 5-foot level may be sloped to preclude collapse. . . .

The complaint alleges that:

> The side(s) of the trenches in hard or compact soil embankment(s), were not shored or otherwise supported when the trench was more than five feet in depth and more than eight feet in length.

It is first necessary to decide whether a violation occurred. The Review Commission has stated, as pointed out by the Secretary, the elements necessary to make a prima facie showing of noncompliance with the standard:

> [T]he Secretary must show that (1) the trench at issue is at least five feet deep and at least eight feet long, (2) the trench is neither shored nor sloped appropriately, and (3) a significant portion of the trench wall is composed of hard or compact soil. A respondent may then rebut this prima facie case by proving that its trench was dug entirely in solid rock, shale, or cement or gravel, which are not required to be shored or sloped. See Secretary v. Co-Con., Inc., 80 OSAHRC 127/D4, _____ BNA OSHC _____, 1977-78 CCH OSHD ¶ 22,035 (No. 76-1228, 1977).

The evidence of record is abundantly clear that the trench in question was approximately 12-13 feet deep and 3 feet wide. In addition, it was neither shored nor sloped, which establishes the first two elements of a prima facie case.

A considerable amount of testimony was directed toward the composition of the soil in the trench. An emergency medical technician at the scene of the cave-in testified that the soil consisted of shale rock, sand, and clay (Tr. 43). A pipelayer, working in the trench, testified that the sides were about six feet of "dirt" and shale, and about seven feet of shale (Tr. 111-112). Mr. Korth, the Secretary's soil expert testified that subsequent to the cave-in, he made four borings and two test pits along Terry Lane to obtain samples most representative of the soil conditions in the trench. The results of the tests showed generally that the materials in the area consisted of fill materials in the top layer underlayed by silty clay with occasional weathered shale seams for depths ranging from 2.5 to 6 feet below ground surface. These conditions were consistent with information obtained from the Arkansas Geological Commission. The material was considered to be of a hard and compact nature (Tr. 160, 163-165; Exh. C-3, pp. 3-4 and logs).

On the basis of the entire record, the evidence sufficiently reflects that a significant portion of the trench walls were composed of hard or compact soil. Thus a prima facie case having been established, and not rebutted, proves the standard was violated.

The question now is whether the violation was of a willful nature. The Secretary contends respondent had knowledge of the standard because of of a prior citation was affirmed for the same violation (Exh. C-1). Also, it is argued that respondent's failure to take positive steps to assure compliance with the trenching standards, particularly with such prior knowledge constitutes careless disregard of or plain indifference to the requirements of the standard. Duane Meyer d/b/a D.T. Construction Co., 79 OSAHRC 57/D4, 7 BNA OSHC 1560, 1564, 1979 CCH OSHD

¶ 23,742 (No. 16029, July 23, 1979). Also, it is insufficient for an employer to rely on the supervisor's experience, 7 BNA OSHC at 1564, or expect employees to use their "common sense." Georgia Electric Co. v. Marshall, 595 F.2d 309 at 320 (5th Cir. 1979). In support of his contention, the Secretary refers to the testimony of Mr. Croxton, respondent's president, who stated that if he were not present, the supervisor directly in charge of the crew decides on how wide to dig the trench (Tr. 39). It is, therefore, reasoned that since the necessary steps were not taken to assure that supervisory personnel would comply with the standard, it was willfully violated.

Respondent asserts that the Secretary has failed to establish the willful nature of the violation as it is not shown there was a conscious, intentional, deliberate and voluntary decision to disregard the requirements of the standard, or that it was plainly indifferent to it. Georgia Electric Co., supra.

Mr. Croxton testified that he was aware of the requirements set forth in the standard and Table P-1, and this resulted in digging the trench with vertical sides as he knew it was being dug in shale (Tr. 36-37, 87-90, 104). He stated that prior to the cave-in, approximately 60,000 feet of trenching had also been dug in accordance with the trenching standards. This included implementation of various measures such as use of trench boxes depending on the material encountered (Tr. 91).

Mr. Korth indicated that there could be a narrow distinction between the types of materials found in the area as the shale rock and soil lie next to each other in various seams, and to a certain extent, the point at which the change occurs requires a subjective determination (Tr. 163, 248, 264-265).

The Commission has taken a clear position in resolving this type situation in stating:

> A trench wall composed of solid rock, shale, or cemented sand and gravel interlayered with areas of hard compact soil will be considered to be the weaker of the two types of materials where the hard and compact components constitute a significant portion of the trench walls. Thus, if a significant part of the material in a trench wall is hard or compact, the trench must be supported in accordance with the requirements of section 1926.652(c) even if some portion of the trench wall is composed of solid rock, shale, or cemented sand and gravel. Co-Con, Inc., supra.

The standard itself does not specify that shale shall be "solid" as a requirement for an unshored trench under Table P-I. The question, therefore, arises as to whether the actions of the company president constituted a willful violation because he was of the opinion that the trench was in compliance with the proper standard. A violation is not willful if the employer had a good faith opinion that the violation conformed to the requirement of the standard. C. N. Flagg & Co.,75 OSAHRC 32/C6, 2 BNA OSHC 1539, 1974-75 CCH OSHD ¶19,251 (No. 1409, 1975) (good faith belief concerning a factual matter critical to the existence of the violation); see also General Electric Co., 77 OSAHRC 88/A2, 5 BNA OSHC 1448, 1977 CCH OSHD ¶21,853 (No. 11344, 1977), and General Electric Co., 75 OSAHRC 50/A2, 3 BNA OSHC 1031, 1975 CCH OSHD ¶19,567 (No. 2739, 1975), (good faith misinterpretation of the terms of the cited standard).

It has also been held that the test of an employer's good faith for purposes of determining willfulness, is an objective one i.e., was the employer's belief concerning a factual matter or concerning the interpretation of a standard, reasonable under the circumstances. See Western Waterproofing Co. v. Marshall, 576 F.2d 139 (8th Cir. 1978).

Although the president erroneously believed trenches dug in shale were exempt from the standard, nonetheless, his belief was reasonable under the circumstances. He stated he was aware of shale being present, and the soil remained substantially the same throughout the trenching operation without previous incident. All witnesses indicated shale was present in the soil being dug, and Mr. Korth testified his boring and pit samples reflected the same type of soil to be found in the trench area. His test revealed a portion of shale (Exh. C-4, #33) which caused the compliance officer to admit that no citation would have been issued if the sides of the trench were composed entirely of the same material.

Shale is not defined in the standard or Table P-I, however, the compliance officer believed they have reference only to hard shale. He also agreed that personal judgment is involved in determining whether certian material comes within the purview of the standard (Tr. 314, 318-319).

The record discloses that respondent was aware of the standard, and possessed a good faith view, though mistaken view of its requirements. The evidence fails to disclose conduct which constitutes an intentional disregard of the requirements, and accordingly, no willful violation of the standard occurred.

Respondent is also charged with a repeated violation of 29 C.F.R. § 1926.652(c) in that the standard was previously violated.

The Commission has held that a violation is repeated if it has entered a final order against the same employer for a substantially similar violation. Secretary v. Potlatch Corporation, 79 OSAHRC 6/A2, 7 BNA OSHC 1061, 79 CCH OSHD ¶ 23,294 (No. 16183, 1979). In this case, a final order has been entered (Exh. C-1), but the issue is whether there has been "a substantially similar violation." In light of the

Potlatch decision, a prima facie case of similarity is established by showing the prior and present violations are for failure to comply with the same standard. This showing may be rebutted, however, by evidence of disparate conditions and hazards associated with the violations. See Secretary v. Kent Nowlin Construction Co., 80 OSAHRC 39/A10, 8 BNA OSHC 1286, 80 CCH OSHD ¶24,458 (Nos. 76-191 & 76-192, 1980).

In this case, the evidence sufficiently rebuts the prima facie showing of similarity so that a repeated violation cannot be sustained. The standard is concerned generally with soil conditions on one hand and proper protection for employees on the other. In the first case, the central issue was the adequacy of the type of protection afforded employees working in a trench. The instant case is concerned with the basic applicability of the standard, and whether respondent is exempt as it contends. Since the two cases involve two separate and distinct issues, the "substantially similar" requirement is not met to prove a repeated violation.

A violation having been established, it must now be determined whether the violation is of a serious nature. For a violation to be deemed serious under section 17(k) of the Act, there must be a substantial probability that death or serious physical harm could result if an accident occurred. The probability that an accident will occur is irrelevant. Frank Swidzinski Company, 81 OSAHRC _____, 9 BNA OSHC 1230, 1981 CCH OSHD ¶25,129 (No. 76-4627, 1981). The record clearly reflects the violation is serious in light of the cave-in on the employees.

The last question for determination concerns the amount of penalty to be assessed for the violation. Under section 17(j) of the Act, the Commission is required to find and give "due consideration" to the size of the employer's business,

the gravity of the violation, the good faith of the employer, and the history of previous violations in determining the assessment of an appropriate penalty. The gravity of the offense is the principal factor to be considered. Nacirema Operating Company, Inc., 72 OSAHRC 1/B10, 1 BNA OSHC 1001, 1971-73 CCH OSHD ¶15,032 (No. 4, 1972). The Commission stated in Secretary v. National Realty and Construction Co., Inc., 72 OSAHRC 9/A2, 1 BNA OSHC 1049, 1971-74 CCH OSHD ¶15,188 (No. 85, 1971), that the elements to be considered in determining the gravity are: (1) the number of employees exposed to the risk of injury; (2) the duration of exposure; (3) the precautions taken against injury, if any, and (4) the degree of probability of occurrence of injury.

Weighing all the foregoing factors in light of the circumstances, it is concluded that a penalty in the amount of $500.00 is deemed appropriate.

ALLEGED VIOLATION OF 29 C.F.R. § 1926.652(e)

The standard states as follows:

> (e) Additional precautions by way of shoring and bracing shall be taken to prevent slides or cave-ins when excavations or trenches are made in locations adjacent to backfilled excavations, or where excavations are subjected to vibrations from railroad or highway traffic, the operation of machinery, or any other source.

The only evidence of this violation is that two dump trucks, a backhoe and a pneumatic compactor were used during the course of the trenching operation. While it is alleged the trench was subjected to vibrations, and perhaps operations of the machinery could produce some vibratory effect, there was no evidence concerning the presence of vibrations, or the effects of any such vibration while the work was being performed.

The Commission has held that in order to prove a violation of section 5(a)(2) of the Act, as alleged here, the Secretary must establish that a particular standard

applies to the facts, there was a failure to comply with the standard, and employees had access to the hazard. Anning-Johnson Co., 76 OSAHRC 54/A2, 4 BNA OSHC 1193, 1975-76 CCH OSHD ¶20,690 (Nos. 3694 & 4409, 1976). Since the evidence does not disclose vibrations to which the trench was subjected, the standard cannot be held to have been violated as the presence of any vibration is pure speculation.

The Commission has also pointed out that the standard speaks of "additional precautions" to be taken "where excavations are subject to vibrations." It must be held in this case that the equipment present at the work site is of the ordinary and usual type which would not require the taking of "additional precautions." Moore Construction Inc., 76 OSAHRC 47/E14, 4 BNA OSHC 1131, 1975-76 CCH OSHC ¶20,632 (No. 5093, 1976). The standard has, therefore, not be violated.

## Findings of Fact

1. Mica Construction Company at all times hereinafter mentioned maintained a place of business at Hot Springs, Arkansas, and had a workplace at Terry Lane in Hot Springs where it was equipped in laying sewer pipe.

2. On December 16-22, 1980, authorized representatives of the Secretary conducted inspections at the aforementioned work site. As a result of the inspection, respondent was issued a citation with notice of proposed penalty.

3. During the time of the inspections, respondent conducted a trenching operation for installation of a ten-inch sewer pipeline.

4. On December 15, 1980, the trench collapsed on respondent's employees. At that time, it was approximately 13 feet deep and 3 feet wide; not shored, sloped or otherwise supported.

5. The evidence does not reveal the presence of "banks" as defined in 29 C.F.R. § 1926.653(c) during the trenching operation.

6. A significant portion of the sides of the trench was composed of hard or compact soil. Shale was also present in the composition.

7. Respondent was aware of the trenching standards and believed the operation was conducted in compliance therewith.

8. Respondent previously received a citation for violation of 29 C.F.R. § 1926.652(c), which became a final order of the Commission. The former violation was not similar to the one charged in the present citation.

9. Operation of the mechanical equipment at the work site was not shown to produce vibrations which would require additional precautions for employees working in the trench.

## Conclusions of Law

1. Mica Construction Company, at all times pertinent hereto, was an employer engaged in a business affecting commerce within the meaning of section 3(5) of the Occupational Safety and Health Act of 1970, and the Commission has jurisdiction of the parties and subject matter herein, pursuant to 10(c) of the Act.

2. Respondent is, and at all times pertinent hereto, required to comply with safety and health regulations promulgated by the Secretary pursuant to section 6(a) of the Act.

3. Respondent was not in violation of the standard at 29 C.F.R. § 1926.652(a) during the period of the inspection.

4. Respondent was in serious violation of the standard at 29 C.F.R. § 1926.652(c) during the time of the inspection.

5. Respondent was not in violation of the standard at 29 C.F.R. § 1926.652(e) during the time of the inspection.

Upon the basis of the foregoing findings of fact and conclusions of law, and the entire record, it is

ORDERED:

1. That part of the citation alleging violation of 29 C.F.R. § 1926.652(a) is hereby vacated.

2. That part of the citation alleging serious violation of 29 C.F.R. § 1926.652(c) is affirmed and a penalty in the amount of $500.00 is hereby assessed.

3. That part of the citation alleging violation of 29 C.F.R. § 1926.652(e) is hereby vacated.

Dated this 28th day of December, 1981.

|---|---|
| SECRETARY OF LABOR,<br>Complainant,<br>v.<br>PIPE-RITE UTILITIES LTD., INC.,<br>Respondent. | OSHRC Docket No. 79-234 |

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

This case is before the Commission for review under section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). The Secretary of Labor ("the Secretary") issued a citation to the Respondent, Pipe-Rite Utilities Ltd., Inc. ("Pipe-Rite") alleging noncompliance with the standard at 29 C.F.R. § 1926.651(c). 1/ The standard requires that walls of excavations that expose employees to danger from moving ground be shored, sloped or supported by some other equivalent means. The citation alleged that three employees were exposed to danger from moving ground in that they were "working in an unshored, unsloped excavation (approximately 16'x16' and 12' deep, sandy soil)."

---

1/ Section 1926.651(c) provides:

> § 1926.651 Specific excavation requirements.
>
> * * *
>
> (c) The walls and faces of all excavations in which employees are exposed to danger from moving ground shall be guarded by a shoring system, sloping of the ground, or some other equivalent means.

Administrative Law Judge J. Paul Brenton vacated the citation. The Secretary filed a petition for review and Commissioner Cleary directed review of the issues raised in the Secretary's petition. We find that the Secretary did not prove that there was a danger from moving ground and we therefore affirm Judge Brenton's decision.

I

Pipe-Rite had been engaged to excavate an area in sandy soil for the installation of a wet well to serve as a lift station at a sewage treatment plant. Inasmuch as the water table was within 2 to 3 feet of the surface, a wellpointing system was placed around the area to be excavated three days before the excavation was dug. The judge described wellpointing as "a system of pipes, inserted into the soil surrounding an area to be opened by excavating, connected with a pumping station to remove the water and dry out the area which will become the sides, faces, or walls of the excavation."

After the bottom of the excavation had been leveled, a crane adjacent to the excavation lowered a pre-formed concrete slab, 8 feet square and 2 feet thick, into the excavation and apparently into its center. When compliance officer Mylott arrived, she observed a pipe being lowered into the excavation and placed end-up on top of the slab. The pipe was 6 feet long and nearly 6 feet in diameter. An identical piece of pipe was then placed on top of the first piece.

The dimensions of the excavation were in dispute at the hearing. Compliance officer Mylott measured the length of the sides at the top by pacing off; she testified that they were 16 feet long. Mr. Simpson, the lead operator for the sewage treatment plant, testified that the length at the top was 12 to 15 feet. Mr. Eakins, Pipe-Rite's president, testified however that the walls were 18 feet

long. Both Mr. Simpson and Mr. Eakins testified that the wellpoints were within 2 feet of the walls.

Whether and to what extent the walls of the excavation were sloped were also sharply disputed at the hearing. No measurements of the dimensions of the bottom of the excavation were taken. Compliance officer Mylott testified that the walls were not sloped, that "[i]t was a straight cut to the bottom . . . ." Mr. Simpson, who saw the excavation at the same time as the compliance officer, testified that it had "straight sides" and that he observed no sloping, except on one side where the wall had "a very slight slope to it." Mr. Eakins testified that the walls were not vertical because vertical walls of sandy soil will not stand even when wellpointed. Mr. Eakins further testified that "[t]he ditch was eight feet at the bottom because this bottom slab was graded off eight foot square," and that, given the top dimensions of the excavation, "there was three feet anyways, slope, to four feet." 2/

Other testimony suggests that the dimensions of the bottom were greater than 8 feet square and therefore that the slope was steeper. Mr. Simpson estimated that there was "[n]ot more than two to three feet" between the edge of the concrete slab and the walls, and that while the slab was lowered, an employee stood off to the side on the bottom to guide it. Compliance officer Mylott testified that the employees applying sealer to the pipe were "[a] couple of feet" from the side of the excavation.

The nature and moisture content of the soil were also at issue at the hearing. Mr. Winterholler, a civil engineer with expertise in soil conditions, testified for the Secretary that he took a sample of undisturbed soil from the area about 7 months after the inspection. The sample had been taken from below

---

2/ Mr. Eakins was evidently referring to the horizontal component of the slope.

the water table; the soil had not then been dried by a wellpointing system. Mr. Winterholler tested the sampled soil for its grain size, plasticity, and moisture content. He testified that the excavation was dug in sandy soil composed of "brown, fine to medium sand with some shell [rock], and slight traces of clay and silt." The moisture content of the sampled soil was 22 1/2%. Compliance officer Mylott testified that the area was much drier when the sample was taken than at the time of the inspection. Mr. Simpson testified that the water table had fallen considerably since the inspection. Both compliance officer Mylott and Mr. Simpson observed moisture in the bottom of the excavation. The compliance officer also observed moisture up to about the 9 foot level of the walls, but Mr. Simpson testified that the walls were dry. Mr. Eakins, Pipe-Rite's president, testified that the soil was dry. Miss Mylott and Mr. Simpson observed loose sand at the bottom of the south wall of the excavation, but Mr. Simpson testified that only small amounts of sand had given way.

All four sides of the excavation had superimposed loads nearby; on two sides there were large sewage treatment tanks, on another side there was a crane, and there was a pile of sand on the fourth side. Mr. Winterholler testified that he was not supplied with information on how full the tanks were and therefore could not determine the effect of the tanks on the stability of the walls; compliance officer Mylott testified that she lacked the training to determine whether the tanks influenced the stability of the walls.

The effect of wellpointing on the stability of the walls was discussed at the hearing. Mr. Winterholler testified that because moisture adversely affects the rigidity of the soil, a wellpointing system "must be used to dry out the area," and that "[i]f the area is dry enough, cuts can be made in sand for a short period of time." Mr. Eakins testified that "wellpointing holds the ground very safely" and that "conditions in the sides were very stable." He described wellpointing as "a practice we exercise quite often for short periods of time."

Counsel for the Secretary asked Mr. Winterholler several hypothetical questions. Mr. Winterholler was first asked to assume that there was an excavation about 12 to 16 feet long on each side and about 12 feet deep in the soil he examined, that it had the superimposed loads noted above, and that the soil appeared to the eye to be moist from the bottom to the 9 foot level. He was then asked whether "[u]nder those circumstances would there be a likelihood of moving ground . . . ." He assumed that the walls were vertical and answered that "there could be a likelihood of moving ground." For the third question, Mr. Winterholler was asked to assume, in addition, that up to the 7 foot level some sand was "apparently sloughing off." He was then asked what the sloughing would indicate; he answered that "either the well points weren't deep enough or that area had some moisture in there." He added that "there is a greater danger of cave-in when the soil is wet . . ., much greater."

II

In his decision Judge Brenton vacated the citation. The judge found that "the walls of the excavation were very dry and that there was no significant amount of the giving away of soil from the walls." The judge also found that the sides and bottom of the excavation were dry, that only "[a] little bit, a small amount of sand . . . was observed to give way." He discounted the conclusion of the Secretary's expert witness that there was a danger of moving ground. The judge stated that Mr. Winterholler's answer to the Secretary's first hypothetical question assumed that the walls were vertical when they were not, that the walls were moist to the 9 foot level when they were not, and that the hypothesis did not include the effect of the wellpointing system. The answer to the third hypothetical question was discounted because the sloughing hypothesized by the Secretary did not occur. As to the effect of the superimposed loads on the stability of the excavation walls, the judge found insufficient evidence to make

a conclusion. The judge concluded that wellpointing together with some sloping were equivalent means of protection within the meaning of the standard.

The Secretary argues that it was "plain error" for the judge to conclude that the wellpoint system here afforded "equivalent protection." The Secretary notes that the slope of the walls was far steeper than that depicted in Table P-1, a table in Subpart P of 29 C.F.R. Part 1926; Subpart P contains excavation and trenching standards.

The Secretary also argues that the judge erred in finding that the soil was "very dry". In his brief, the Secretary describes the soil as "moist" and for support cites the testimony of the compliance officer and the sewage plant official who both testified that they observed moisture at the bottom of the trench. The Secretary also contends in his brief that there was a danger of moving ground because dirt was sloughing off the sides of the excavation, a large crane was adjacent to the excavation, and two large holding tanks were within a few feet of the excavation.

III

For the Secretary to prove noncompliance with section 1926.651(c), he must first prove that there is a danger from moving ground. See Seaward Construction Co., 77 OSAHRC 75/C5, 5 BNA OSHC 1422, 1977-78 CCH OSHD ¶ 21,803 (No. 8684, 1977). We conclude, for the reasons that follow, that Pipe-Rite's employees were not shown to have been exposed to a danger of moving ground. We therefore need not consider whether the judge correctly found that wellpointing together with some sloping were "equivalent means" of protection within the meaning of the standard.

The Secretary argues that Judge Brenton erred in finding that the "walls of the excavation were very dry and that there was no significant amount of the giving away of soil from the walls." However, the judge's findings were based

largely on his view of the credibility of the witnesses. We see no reason to disturb the judge's findings. See C. Kaufman, Inc., 78 OSAHRC 3/C1, 6 BNA OSHC 1295, 1297, 1977-78 CCH OSHD ¶ 22,481, p. 27,099 (No. 14249, 1978). The judge correctly found that the soil sample does not reliably indicate the stability of the excavation's walls because the soil of the walls, unlike the sampled soil, "had been under the influence of the well point system for over 48 hours and had dried out." We also agree with the judge's view that the soil expert's answers to the first and third hypothetical questions are of little value because important facts not in evidence were hypothesized and important facts in evidence were not hypothesized.

In addition, the record does not permit a reliable calculation of the degree of sloping because no measurements were taken of the dimensions of the bottom of the excavation. Furthermore, as the expert witness testified, there is insufficient evidence to determine the effect of the nearby superimposed loads on the stability of the excavation walls. Finally, noncompliance with the sloping requirements of Table P-1 is not sufficient to establish a danger from moving ground within the meaning of section 1926.651(c). See Seaward Construction, 5 BNA OSHC at 1423, 1977-78 CCH OSHD at p. 26,243.

Accordingly, the judge's decision is affirmed and the citation is vacated.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: JAN 28 1982

COTTINE, Commissioner, dissenting:

The majority's vacation of the citation in this case is inconsistent with Commission precedent and unsupported by the record evidence. Accordingly, I dissent.

The standard at §1926.651(c) provides that "[t]he walls and faces of all excavations in which employees are exposed to danger from moving ground shall be guarded by a shoring system, sloping of the ground, or some other equivalent means." (emphasis added). As part of his prima facie case for alleged violations of this standard the Secretary is required to establish that there is employee exposure to a danger of moving ground. See M.J. Lee Construction Co., 79 OSAHRC 12/A2, 7 BNA OSHC 1140, 1979 CCH OSHD ¶23,330 (No. 15094, 1979); Seaward Construction Co., 77 OSAHRC 75/C5, 5 BNA OSHC 1422, 1977-78 CCH OSHD ¶21,803 (No. 8684, 1977). The Commission has also held that the terms "danger from moving ground" in §1926.651(c) and "unstable or soft material" in §1926.652(b) describe equivalent soil conditions and that an excavation dug in "unstable soil" by definition creates a "danger from moving ground".[1/] M. J. Lee Construction Co., supra; D. Federico Co., Inc., 76 OSAHRC 13/A2, 3 BNA OSHC 1970, 1975-76 CCH OSHD ¶20,422 (No. 4395, 1976), aff'd on other grounds, 558 F.2d 614 (1st Cir. 1977); West Coast Construction Co., 76 OSAHRC 149/F1, 4 BNA OSHC 1940, 1976-77 CCH OSHD ¶21,419 (No. 7454, 1976). Furthermore, the Commission has held that the excavation and trenching standards, including Tables P-1 and P-2, create a rebuttable presumption that predominately sandy soils, unless cemented, are soft and unstable

---

1/ "Unstable soil" is defined at 29 C.F.R. §1926.653(q) as "[e]arth material, other than running, that because of its nature or the influence of related conditions, cannot be depended upon to remain in place without extra support."

within the meaning of §1926.652(b). See Duane Meyer d/b/a D.T. Construction Co., 79 OSAHRC 57/D4, 7 BNA OSHC 1560, 1979 CCH OSHD ¶23,742 (No. 16029, 1979). Inasmuch as the terms "unstable soil" and "danger from moving ground" are equivalent, it follows that if sandy soil satisfies the definition of one term (unstable soil) it also satisfies the definition of the other term (danger from moving ground). Accordingly, predominately sandy soil in an excavation wall creates a danger of moving ground.

The evidence in this case clearly establishes that the cited excavation was dug in noncemented, predominately sandy soil. A sample of soil taken from the wall of the cited excavation revealed the walls to be composed of brown, fine to medium sand with some shell, and slight traces of clay and silt. Witnesses for both parties described the soil as primarily sandy in composition and no evidence was presented that the soil was cemented. Under Commission precedent the soil was unstable, could not be depended on to remain in place without support, and, accordingly, presented a danger of moving ground within the meaning of §1926.651(c). See M.J. Lee Construction Co., supra.

The majority simply relies on Seaward Construction Co., supra, for the proposition that noncompliance with the sloping requirements of Table P-1 is not sufficient to establish a danger from moving ground within the meaning of §1926.651(c). However, my colleagues ignore the other Commission case law cited above establishing as a matter of law that the unsupported soil in the cited excavation presented a danger of moving ground within the meaning of §1926.651(c).

The record in this case establishes that the walls of the excavation were not sloped to an appropriate angle of repose to guard against collapse. My colleagues correctly note that the record does not permit a reliable calculation of the degree of sloping. However, even if the

evidence is viewed in a light most favorable to the Respondent, the slope is inadequate. Based upon the more favorable dimensions presented by Pipe-Rite's president showing the excavation to be a 16 foot square on top, an 8 foot square on the bottom, and 10.5 feet deep, the walls were sloped at a 69° angle. The Secretary's soil expert testified that the appropriate angle of repose for the soil in the excavation was 29°.[2/] Table P-1 approximates the angle of repose for compacted sharp sand to be 33° 41' and for well rounded loose sand to be 26° 34'. Clearly, the excavation was not sloped to the appropriate angle of repose.

Seaward Construction Co., supra, on which my colleagues rely, was based on the erroneous conclusion that "[t]he 1926.651 excavation standards neither contain nor refer to these tables [Tables P-1 and P-2] or any other specific requirements for sloping or shoring." 5 BNA OSHC at 1423, 1977-78 CCH OSHD at p. 26,243. However, §1926.651(g) clearly states that "[a]ll slopes shall be excavated to at least the angle of repose except for areas where solid rock allows for line drilling or presplitting." Table P-1 is entitled "Approximate Angle of Repose for Sloping of Sides of Excavations." (emphasis added). The table sets forth the angles of repose at which respective soils in the walls of an excavation "will lie without sliding." See note 2, supra.[3/] Accordingly, walls of an excavation that do not comport with the table have not been sloped to their required angles of repose and do not comply with the requirements of the excavation standards.

---

2/ 29 C.F.R. §1926.653(b) defines "angle of repose" as "[t]he greatest angle above the horizontal plane at which a material will lie without sliding."

3/ The Commission has stated that "the angles of repose set forth in Table P-1 represent the maximum safe slopes for the soil classifications listed." Duane Meyer, d/b/a D.T. Construction Co., supra, 7 BNA OSHC at 1563 n. 12, 1979 CCH OSHD at p. 28,793 n. 12.

The Secretary has established that the excavation was composed of sandy soil that was inadequately sloped and lacked any shoring support structures.[4/] Since three employees were exposed to the danger of moving ground, the Secretary has carried his burden of proof. The Respondent's argument that it used a wellpoint system as a method of protection is without merit. The function of the wellpoints is simply to eliminate the presence of ground water as a contributing factor to soil instability.[5/] Wellpoints do not abate the hazard of moving ground and do not constitute equivalent means of protection within the meaning of the cited standard.[6/] Respondent's argument that its employees were in the trench for only a short period of time is irrelevant to the existence of the violation. Duration of exposure to a hazard is an appropriate consideration in assessing a penalty but it is not a defense to the underlying violation. See American Bechtel, Inc., 77 OSAHRC 214/A2, 6 BNA OSHC 1246, 1977-78 CCH OSHD ¶22,466 (No. 11340, 1977).

The citation should be affirmed.

---

4/ The majority correctly notes that there is insufficient evidence to determine the effect of the nearby superimposed loads on the stability of the excavation walls. However, it must be noted that, if there was any effect, it would be to detract from, not add to, the stability of the excavation walls. See §1926.651(e).

5/ The soil expert testified that because moisture adversely affects soil rigidity, "a well point system or some kind of a pumping system must be used to dry out the area." Hearing transcript at 40. Also see §1926.651(h) which requires that the angle of repose be flattened where water conditions exist.

6/ According to Mr. Simpson, the lead operator at the sewage treatment plant, "[t]he well point system itself surrounded the hole and didn't affect the hole at all." Hearing transcript at 28.

APPEARANCES

Larry A. Auerbach and Stephen J. Simko, Jr., Esquires,
U. S. Department of Labor, Office of the Solicitor,
Atlanta, Georgia, on behalf of complainant.

Mr. Douglas S. Eakins, President (Pro Se)
Pipe-Rite Utilities Ltd., Inc.,
7544 Lake Worth Road,
Lake Worth, Florida 33463

Brenton, Judge

## STATEMENT OF THE CASE

This case involves an excavation in which respondent engaged in the installation of a wet well to serve as a lift station in a sewage treatment plant, located west of the city of Lake Worth, Florida.

Teresa Mylott, compliance officer for complainant, during an assigned inspection of a crane company on December 18, 1978, at that sewage plant observed the excavation, and later on the same day investigated and inspected the excavation in accordance with the Occupational Safety and Health Act of 1970. This activity resulted in the issuance of a citation and a proposed $400.00 penalty for violation of a specific excavation regulation (§5(a)(2) of the Act).

Respondent contested the citation and penalty. A complaint was filed, and after respondent's notice of contest was treated as an answer, the case was heard in West Palm Beach, Florida on July 10, 1979.

## JURISDICTION

Respondent did not deny the jurisdictional allegations of the complaint nor raise an issue of jurisdiction at any stage of the proceedings, thus it concedes that it is engaged in a business affecting commerce.

## THE CHARGE

Three employees working in the excavations were exposed to danger from moving ground because the sandy soil walls or faces of that excavation were not guarded by a shoring system, sloping of the ground, or some other equivalent means in violation of the cited standard (29 C.F.R. 1926.651(c)).

## ISSUES

Whether any employee of respondent was exposed to danger from moving ground.

Whether the walls and faces of the excavation were guarded by means equivalent to a shoring system or sloping of the ground.

If the cited standard has been violated, is it a serious violation of the Act?

If a violation exists as charged, what amount in penalty should be assessed?

## MATERIAL FACTS

1. Respondent well pointed the area to be excavated on Friday [December 15, 1978]. Excavating did not commence until the following Monday, December 18, 1978.

2. Well pointing is a system of pipes, inserted into the soil surrounding an area to be opened by excavating, connected with a pumping station to remove the water and dry out the area which will become the sides, faces, or walls of the excavation.

3. In this case, the well point pipes were in sections at 18 inch centers and formed a 20 foot square when inserted into the soil. The pump ran continuously after installation. The excavation was made inside the well point installation so as to make a 16 to 18 foot square hole at the surface. The excavating was done in two stages. Its depth was not completed until a crane arrived for the purpose of lifting, lowering and setting the concrete slab and pipes to form the lift station.

4. Immediately after the required depth was reached, three employees entered the excavation by means of a ladder and in fifteen minutes had manually leveled off an eight foot square area on the bottom. After that operation, they ascended the excavation.

5. The next operation was the setting of a concrete slab, eight feet square and two feet thick by means of the crane.

6. Following that activity, tar mastic is placed around the perimeter of the first section of pipe which has been lowered into the hole to rest on the slab by the crane. The employees again descended into the hole by means of the ladder to perform that operation.

7. The concrete pipe for the station was in two sections, six feet in diameter and six feet in length. As each piece is lowered into the excavation, the employees guide it into position from above the concrete; they are not in the excavation during these operations except one may operate from a position on the ladder.

8. The excavation was made in undistrubed soil. The soil was described as: "brown, fine to medium sand with some shell, slight traces of clay and silt." (Tr. 43).

9. The depth of the excavation was estimated by complainant's witnesses at 10 to 12 feet. Respondent's president testified it was 10 1/2 feet in depth. It was essentially square at 16 to 18 feet in length on each side at the top.

10. The walls and faces of the excavation were vertical, according to the compliance officer and one witness. According to respondent's president, they were sloped because vertical sand will not stand up and the bottom of the excavation was eight feet square.

11. The earth surfaces, vertical or inclined, formed as a result of the excavation work were not guarded by a shoring system installed within the excavation.

12. Where any excavation is made in the sand, a well point system or same kind of a pumping system must be used to dry out the area.

13. Where a well point system is in use and the area has been dried out enough, cuts can be made in the sand for a short period of time.

14. Well points installed on 18 inch centers will help stabilize and give strength to the ground [walls or faces]. Well points consolidate the soil for excavating purposes.

15. The samples taken two feet from the excavation by complainant's soil expert on July 6, 1979, contained 22 1/2 percent moisture, which would affect the rigidity of that soil.

16. The sides of the excavation during the leveling of its bottom and the installation of the materials forming the lifter station were dry (Tr. 20, 29, 34).

17. Loose sand was observed on the bottom at the south wall of the excavation.

18. There were no cracks nor seepage of water in any wall.

19. A little bit, a small amount of sand at the bottom near the base was observed to give way.

20. The excavated material was stored in a pile two to three feet from one edge of the excavation. Two sewage treatment tanks were nearby the excavation, one seven feet from the north wall and the other about 10 feet away at another location. The crane was positioned 10 to 12 feet from the excavation.

21. The compliance officer did not go into the bottom of the hole. She had no measurements of the dimensions of the excavation at its bottom.

22. After the concrete slab was set in place in the bottom of the hole, there was, according to Mr. William Simpson, no more than two to three feet from its perimeter to the walls and faces of the excavation (Tr. 32).

23. After the first section of pipe had been set on the slab, Teresa Myott observed employees walking around the pipe covering its top edge with sealer material. During that activity, the distance between the employees and the sides of the excavation was two feet (Tr. 55).

24. After the two concrete sections of pipe were set, the hole was partially filled in before employees sealed the joints in the concrete (Tr. 31).

25. Complainant's hypothesis propounded to the soil expert, James Winterholler, included facts not in evidence and failed to include facts in evidence (Tr. 41, 42). There was no evidence of soil sloughing off the sides of the excavation above seven feet from the bottom which the hypothesis included, and there was evidence that the well point system had been installed and had been pumping the moisture out for over 48 hours, which was not included in the hypothesis.

26. No witness was in possession of sufficient information to calculate the load of any nearby structure and the pressure either might impart on any one of the sides of the excavation.

27. Movement of the crane with a load on it up close to the hole could have influenced the stability of the sides of the excavation, but there is no evidence that it was ever moved from its position 10 feet away from the hole.

## LAW AND OPINION

In this case, the ground in which the excavation was to be made and the work performed was known by the respondent to be composed essentially of sand. Moreover, respondent was aware of the moisture content of that sand and its consequent instability. Thus, respondent knew that it was necessary to protect its employees, during the times they would be required to be in the proposed excavation, from the ground that could move from its walls and faces. In this kind of situation, industry practice dictates the use of well points because their primary purpose is to consolidate the soil, according to the credible testimony of Douglas Eakins, respondent's president, and James Winterholler, the soil expert. In addition, this expert testified that a properly installed well point system stabilizes and strengthens the soil, and that if the area is dry enough, cuts can be made in the sand for a short period of time.

Consolidation of the soil means that the particles of the soil have been united or combined to become firm. The drying out process causes the soil particles to cohere in the sense of cementation.

In this case, in accordance with industry practice, respondent used the well point system to make the walls and faces of its excavation stable during the short intervals that its employees would work in the hole. Respondent set the structure

[lift station] within 30 minutes after the final excavation work was completed, which was the manual leveling process at the bottom.

Complainant argues that respondent violated the Act as charged because the soil expert testified there was danger of moving ground. The expert made that observation on the hypothesis that the soil in the excavation was moist from the bottom up to about nine feet, together with the facts of the surrounding structures, equipment, and excavated soil, but the hypothesis did not include the fact of installation and operation of the well point system nor the angle, if any, of the walls and faces. Although the initial hypothesis did not describe the walls, it is inferred from the facts that the expert assumed that the walls were vertical. The expert voluntarily included that assumption when the second hypothesis was propounded to him.

The third hypothesis added sloughing of the walls up to seven feet from the bottom. No witness, however, made that kind of statement. The compliance officer did testify she saw loose sand at the bottom of the south wall that went up seven feet. This may well have been the side which Mr. Simpson had in mind when he testified one side had a slight slope in it, which was the side from which the digging equipment worked and pulled the dirt out. Mr. Simpson also testified that the walls were very dry, and that the only place where the excavation was a little damp or moist was in the very bottom. Further, Mr. Simpson testified seeing a small amount of sand give way from the sides near the bottom of the hole, a "little bit."

The preponderance of the reliable, credible and probative evidence is conclusive that the walls of the excavation were very dry and that there was no significant amount of the giving away of soil from the walls.

The compliance officer testified that the walls were vertical. Mr. Simpson's testimony indicates that two sides were vertical (Tr. 20, line 15). On the other hand, there is credence to Mr. Eakins testimony that there was some sloping of the walls. Teresa Myott and William Simpson testified that at the time the employees were in the hole, walking around the first installed pipe on the slab, putting the sealer on the perimeter of that pipe, there was only two feet distance between them and the walls of the excavation. The diameter of that pipe was six feet and it was set in the center of an eight foot slab. Thus, the dimensions of the bottom of the excavation could not have exceeded nine or possibly ten feet to each side. Mr Eakins testified it was only eight feet square. No measurements were made of the bottom dimensions. Nevertheless, the preponderance of all the facts and circumstances in evidence show that the bottom dimensions of the excavation were considerably smaller than the top. Therefore, the evidence clearly shows that there was some sloping of the ground composing the walls and faces of the excavation.

There was no cave-in nor any significant loosening of the soil of the walls during any of the time this excavation was open.

If any one of the three structural components of the lift station struck a wall of the excavation during its descent, some kind of cave-in would be likely. In this case, no employee was in the excavation during those operations. In guiding those components, they were always above them or to the side elevated upon a ladder.

The soil experts soil sample was extracted in July, 1979, and contained 22 1/2 percent moisture. This in no way compares to the soil of the walls of the excavation at the time they had been under the influence of the well point system for over 48 hours and had dried out. The angle of repose was calculated from the soil sample at 29 degrees. On that basis, complainant argues that the walls should have been sloped halfway between 1 1/2 : 1 and 2:1.

Mr. Winterholler, the expert, had difficulty in predicting the action, if any, of the sides of the excavation under all the facts and circumstances in evidence because he had not calculated the surcharge weight of the structures around [the excavation] and how they would have influenced the sides. This information was not available from any witness.

Mr. Winterholler did testify that if the well points are in correctly, two to three feet below the bottom of the cut, and if the sides are dry, the excavation should stay open if there is no other influence.

Mr. Winterholler further testified from the facts and circumstances in evidence that if the hole was open for an hour or an hour and a half, without any surcharge weight around it, that the chances are that a cave-in would not have occurred. Also, in answer to the question "would [it] cave-in in ten or fifteen minutes," he testified: "again, I can't predict it but I would doubt it." In these latter two instances, it is inferred that Mr. Winterholler assumed the walls of the excavation were vertical.

No employee was subject to injury or death during the course of his work in this excavation because respondent guarded the walls and faces, protecting its employees from the danger of moving ground, by the installation of an appropriate well point system which consolidated the particles of the soil composing those walls and faces, and gave that soil strength and stability. This action, together with some sloping of the walls and faces, was equivalent to either the installation of a shoring system, trench box, or a sloping of the ground 2:1 (26 degrees, 34 minutes). Moreover, respondent did not permit an employee to be in the excavation at any point which would subject him to danger of moving ground had the lowering of the concrete adversly bumped a wall which could have caused a cave-in.

The use of means to guard the walls and faces of an excavation from ground movement equivalent to a shoring system or sloping of the ground is authorized by the cited standard (29 C.F.R. 1926.651(c)).

Complainant by his citation undertook the burden of proving that the walls and faces of respondent's excavation in which respondent's employees would or could be exposed to danger from moving ground were not guarded by a shoring system, sloping of the ground, or some other equivalent means. Complainant successfully met this burden with respect to proving there was no visible shoring system such as a trench box installed against the walls and faces, and that there was inadequate sloping of those walls and faces. Complainant, however, failed to carry his burden of showing that those walls and faces were not guarded by a means equivalent to a shoring system or an adequate sloping of the ground.

The preponderance of the reliable, probative, and credible evidence having shown that the means used by respondent to protect his employees from moving ground, at the times they were down in the excavation, was equivalent to the specific means of shoring or sloping the citation should be vacated.

## CONCLUSIONS OF LAW

The Review Commission has jurisdiction to hear and decide this case.

Where an excavation is to be made in wet sand and a well point system is correctly installed around the area to be excavated, and utilized to pump that area dry, it will make the walls and faces of the excavation when opened stable and unlikely to move for a short period of time.

If the walls and faces of that excavation are sloped to some extent, those walls and faces will possess an added or extra dimension of strength.

Under all the particular and peculiar facts and surrounding circumstances of this case, respondent did not violate the Act as charged and tried.

ORDER

The citation is vacated.

No penalty is assessed.

# NOTICE OF DECISION

Secretary v. Crayton's Southern Sausage Company, Inc.

OSHRC Docket No. 81-346S

1. Enclosed is a copy of my decision. It will be filed with the Commission on December 29, 1981, and will become the final order of the Commission on January 28, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N. W., Suite 601
   Washington, D. C. 20006

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is January 28, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

APPEARANCES:

Mary Anne Garvey and Bruce C. Heslop, Esquires, Office of the Solicitor, U. S. Department of Labor, Cleveland, Ohio, on behalf of complainant

Arthur B. Heard, Esquire, Cleveland, Ohio, on behalf of respondent

## DECISION AND ORDER

EWING, Judge: This is a proceeding brought before the Occupational Safety and Health Review Commission ("the Commission") pursuant to section 10 of the Occupational Safety and Health Act of 1970 ("the Act"), 29 U.S.C. § 651 et seq. Respondent contests item 2 of an "other" citation.

An inspection was conducted at respondent's workplace on January 12, 1980. Simplified proceedings were ordered in this case at the request of complainant.

Respondent was represented by counsel. A hearing was held in this matter on May 15, 1981, in Cleveland, Ohio. No additional persons desired to intervene in this matter.

Both parties filed post-hearing briefs.

The parties stipulated that respondent is engaged in a business affecting commerce and has employees within the meaning of the Act, and the Commission has jurisdiction of the parties and of the subject matter (Joint Ex. 1).

The issue remaining is: (1) whether respondent is in nonserious violation of 29 C.F.R. § 1910.23(d)(1)(ii).[1/]

The allegations in item 2 of the citation, in pertinent part, read as follows:

> Flight(s) of stairs with 4 or more risers, less than 44 inches wide and having one side open, were not equipped with a standard stair railing on the open side:
>
> In dock area, 2 flights of stairs without railings on open side.

No penalty was proposed for the alleged violation in item 2 of the citation.

## SUMMARY OF EVIDENCE

Compliance Officer Joan A. Anderson was called to testify on behalf of complainant (Tr. 7-8). She conducted an inspection of respondent's workplace in Cleveland, Ohio, on January 12, 1980 (Tr. 9). She testified that she observed that

---

1/ § 1910.23 Guarding floor and wall openings and holes.

* * *

(d) Stairway railings and guards. (1) Every flight of stairs having four or more risers shall be equipped with standard stair railings or standard handrails as specified in paragraphs (d)(1)(i) through (v) of this section, the width of the stair to be measured clear of all obstructions except handrails:

* * *

(ii) On stairways less than 44 inches wide having one side open, at least one stair railing on open side.

there were two flights of stairs leading from the ground level to a loading dock (Tr. 10-13). Mrs. Anderson took a photograph of one flight of stairs (Tr. 11-12; Ex. C-1). She indicated the two flights of stairs were identical (Tr. 10-13). Mrs. Anderson indicated each flight of stairs had four risers, and each stairway was less than 44 inches wide and each had one side open (Tr. 12-13). The stairways were actually 36 inches wide (Tr. 13). The stairs were exposed to the weather (Tr. 13; Ex. C-1). She was of the opinion that the open side of the stairs posed a falling hazard to respondent's employees using them (Tr. 13). She indicated that if an employee fell from the stairs, he could sustain contusions, lacerations, abrasions and possibly more serious injuries (Tr. 13). Two of respondent's truck drivers used the stairs on a daily basis (Tr. 14).

She testified an opening and closing conference was held (Tr. 9-10, 14).

Mrs. Anderson indicated the hazard could be abated by the installation of railings on the open sides.

As a result of Mrs. Anderson's findings, a citation was issued on January 16, 1981.

Mrs. Anderson indicated there was snow and ice on the stairs (Tr. 16).

Mr. Eric D. Jeffries, president of respondent, was called as a witness for respondent (Tr. 19). He indicated the building, loading dock and stairs were constructed in 1954 (Tr. 20). He testified the loading dock roof extended out over the stairs (Tr. 20). He indicated there has never been an injury on the stairs since they were built (Tr. 20). He testified no more than two truck drivers use the stairs each day; other employees are prohibited from using the stairs (Tr. 20-21). He indicated the flights of stairs had handrails on their wall side (Tr. 21). He testified it was difficult, if not impossible, for two people to walk up and down the stairs at once (Tr. 21). He contended that the installation of handrailing on the stairs would

create a greater hazard than the use of the stairs without handrails on the open side (Tr. 22). He indicated the handrailing support posts would create a tripping hazard where they would be anchored to the risers and dock floor (Tr. 22-24). He testified that he had not applied for a variance (Tr. 25-26). He indicated he had never heard of the rule. He stated that respondent had not tried to install handrails (Tr. 27-28). Mr. Jeffries stated the bumper guards were secured by bolts through the brick mortar (Tr. 28; Ex. C-1).

## OPINION

In order to prove a violation of § 5(a)(2) of the Act in an ordinary case, the Secretary must show by a preponderance of the evidence that (1) the cited standard applies; (2) there was a failure to comply with the cited standard; (3) employees had access to the violative conditions; and (4) the cited employer knew or, with the exercise of reasonable diligence, could have known of the condition. Daniel International Corporation, _____ OSAHRC _____, 9 BNA OSHC 2027, 1981 CCH OSHD ¶ _____ (No. 76-181, June 30, 1981). One of the intended purposes of the Act is to prevent the first accident. Secretary of Labor v. Lee Way Motor Freight, Inc., 511 F.2d 864, 869-870 (10th Cir. 1975).

Applying the criteria set forth in Daniel International Corporation, supra, to the facts in this case, I conclude that complainant established a prima facie violation of § 5(a)(2) of the Act. It is undisputed that each of the flights of stairs had four risers, the width of the stairs were less than 44 inches, and they had an open side that was not provided with standard stair railings. Two of respondent's truck drivers used the stairs on a daily basis. The compliance officer testified that a fall from the stairs could result in injuries ranging from contusions, lacerations and abrasions to those of a more serious nature. The stairs were exposed to the

elements and had accumulations of ice and snow on them. Respondent knew of the condition. Respondent can avoid liability only by establishing an affirmative defense.

Respondent argues the cited standard is arbitrary in its application. The Commission lacks the power to question the wisdom of a standard; e.g., Van Raalte Co., Inc., 76 OSAHRC 48/B8, 4 BNA OSHC 1151, 1975-76 CCH OSHD ¶ 20,633 (No. 5007, 1976).

Respondent contends that the open-sided stairs posed no hazard to employees because none of its employees had been injured from a fall from the stairs. I reject this contention. The Commission has held that the existence of a hazard is not negated by a favorable safety record that an individual employer may have experienced. F. H. Lawson Co., 80 OSAHRC 19/A14, 8 BNA OSHC 1063, 1980 CCH OSHD ¶ 24,277 (No. 12883, 1980). See A. E. Burgess Leather Company, Inc., 77 OSAHRC 25/D6, 5 BNA OSHC 1096, 1977-78 CCH OSHD ¶ 21,573 (No. 12501, 1977), aff'd, 576 F.2d 948 (1st Cir. 1978).

Respondent contends that compliance with the standard would create a greater hazard than the use of the stairs without stair railings. Respondent argues that the upright supports for stair railings would have to be installed on the outer edge of the bottom step and on the surface of the loading dock at the top of the stairs, and this might cause a tripping hazard.

In order to sustain a claim of greater hazard as a defense, respondent must prove that (1) compliance with the cited standard would diminish rather than enhance employee safety; (2) alternative means of protecting the employees are unavailable or, if available, are used; and (3) a variance under 29 U.S.C. § 655(d) is inappropriate. H. S. Holtze Construction Company, 79 OSAHRC 82/A2, 7 BNA OSHC 1753, 1979 CCH OSHD ¶ 23,925 (No. 16059, 1979), rev'd in part on other

grounds, No. 79-1957 (8th Cir., August 8, 1980). Respondent has made no attempt to install standard stair railings.

Respondent has failed to make a showing that alternative means of employee protection are unavailable or, if available, are being used, and that a variance is inappropriate. It made no application for a variance.[2/] Complainant's Exhibit C-1 shows a wall stair railing anchored to the brick wall and truck back-up bumpers anchored to the metal facing of the dock floor and the brick wall foundation. It is obvious that a stair railing support could be anchored to the vertical side of the stairs and the brick wall under the dock floor.

The defense of greater hazard requires a showing of increased risk, not the mere possibility of a different hazard. Hurlock Roofing Co., 79 OSAHRC 93/A2, 7 BNA OSHC 1867, 1979 CCH OSHD ¶ 24,006 (No. 14907, 1979). Even where an employer cannot fully comply with all standards, it must still provide such protection as is possible. See Martin Tomlinson Roofing Company, Inc., 80 OSAHRC 4/B12, 7 BNA OSHC 2122, 1979 CCH OSHD ¶ 24,167 (No. 76-2339, 1979).

Complainant made out the elements necessary to prove a violation of the standard at 29 C.F.R. § 1910.23(d)(1)(ii). Respondent has failed to rebut this showing and has failed to sustain the interposed defense of greater hazard.

## FINDINGS OF FACT

1. Respondent is a corporation that was engaged in the sausage processing business in Cleveland, Ohio, on Januray 12, 1980 (Tr. 9).

---

2/ Respondent states in its brief that it has applied for a variance since the hearing. I conclude this statement should have no influence on this decision.

2. On January 12, 1980, Compliance Officer Joan A. Anderson conducted an inspection of respondent's workplace in Cleveland, Ohio (Tr. 7-8).

3. The compliance officer held an opening and closing conference with respondent's management (Tr. 9-10, 14).

4. There were two flights of stairs leading from the outside ground level to the loading dock at respondent's workplace (Tr. 11-13; Ex. C-1).

5. Each flight of stairs had four risers; the stairs were less than 44 inches wide and had one side open (Tr. 12-13).

6. The stairs were actually 36 inches wide (Tr. 13).

7. The stairs were exposed to the weather and had an accummulation of ice and snow on them (Tr. 13-16; Ex. C-1).

8. Two of respondent's employees used the stairs on a daily basis (Tr. 14).

9. The open side of the stairs presented a fall hazard.

10. If an employee fell from the stairs, he could sustain contusions, lacerations, abrasions and possibly a concussion (Tr. 13).

11. Respondent knew or, with the exercise of reasonable diligence, could have known of the fall hazard.

12. There was not a substantial probability that death or serious physical injury could result from a fall from the stairs (Tr. 13).

13. Respondent failed to protect its employees from the fall hazard posed in § 1910.23(d)(1)(ii).

## CONCLUSIONS OF LAW

1. Respondent, Crayton's Southern Sausage Company, Inc., is a corporation engaged in a business affecting commerce and has employees within the meaning of

section 3(5) of the Act. The Commission has jurisdiction of the parties and of the subject matter in this proceeding.

2. Respondent was in nonserious violation of 29 C.F.R. § 1910.23(d)(1)(ii).

## ORDER

Based upon the findings of fact and conclusions of law, it is

ORDERED: (1) Item 2 of the nonserious Citation No. 1 is AFFIRMED, with no penalty proposed, and no penalty is ASSESSED.

(2) The respondent shall abate the cited hazard immediately.

Dated this 29th day of December, 1981.

UNITED STATES OF AMERICA
OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR,<br>Complainant,<br>v.<br>BAROID DIVISION OF NL INDUSTRIES, INC.,<br>Respondent. | OSHRC Docket No. 16096 |

ORDER

Before ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

This case is before the Commission on remand from the United States Court of Appeals for the Tenth Circuit. Baroid Division of NL Industries, Inc. v. OSHRC, 660 F.2d 439 (10th Cir. 1981).

In a previous decision in this case, 1/ the Commission determined that Respondent, Baroid Division of NL Industries ("Baroid"), violated section 5(a)(1) 2/ of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678, in that Baroid failed to protect its employee working at an oil drilling site from fire and explosion hazards resulting from natural gas accumulation. Among other things,

---

1/ 79 OSAHRC 45/A9, 7 BNA OSHC 1466, 1979 CCH OSHD ¶ 23,661 (No. 16096, 1979).

2/ Section 5(a)(1) provides:

Sec. 5.(a) Each employer —

(1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees.

the Commission found that Baroid had failed to adequately train its "mud man," Boden, concerning the detection and evaluation of natural gas accumulation hazards so that Boden would know under what circumstances it would be necessary to leave the oil drilling site.

In its decision, the Tenth Circuit refrained from ruling on whether it was feasible to train Baroid's mud man to detect hazardous levels of gas accumulation by sense of smell. 3/ Because this basis of liability was not mentioned in the citation, the court determined that the parties should be afforded the opportunity to reopen the record to present evidence on this issue. The court stated:

> We therefore remand this case for further development of the record through a hearing on the issue whether training employees to measure hazardous levels of gas accumulation by sense of smell is feasible. If the evidence shows that detection by employees of hazardous levels of gas accumulation by sense of smell is feasible, and if training employees to so detect the gas accumulations is feasible, then the citation will stand. If, on the other hand, the evidence does not show that training to detect hazardous levels of gas accumulation by sense of smell is feasible, the citation must fall. Both parties will be permitted on remand to supplement the record through the presentation of evidence. The Secretary, however, will be limited to presenting evidence on the issue of training employees to detect gas accumulations by sense of smell, and may not present evidence on training in other detection methods such as the use of electronic monitors.

660 F.2d at 448.

Accordingly, this case is remanded to Judge James A. Cronin, the judge who initially heard and decided this case. 4/ The judge shall permit the parties to

---

3/ The court concluded, however, that other theories of liability that were advanced in this case did not establish a violation of § 5(a)(1).

4/ Chairman Rowland was not a member of the Commission when the prior decision was issued in this case. He expresses no opinion on the merits of the case and joins in the instant remand order for the limited reason that the decision of the Tenth Circuit has established the law of the case.

present further evidence and argument with respect to the remanded issue. He also shall make findings of fact on the issue and shall enter an order disposing of the section 5(a)(1) citation consistent with those findings and with the court's remand order.

SO ORDERED.

FOR THE COMMISSION

For the Respondent

DECISION AND ORDER

Cronin, Judge, OSHRC: This is a proceeding under section 10 of the Occupational Safety and Health Act of 1970 (29 U.S.C. §651, et seq., hereinafter called the Act) involving an investigation commenced on October 16, 1975,

by the U. S. Department of Labor of an accident occurring on October 10, 1975, at a worksite east of Custer City, Oklahoma.

As a result of this investigation a citation characterized as "SERIOUS" and alleging a violation of section 5 (a)(1) of the Act (29 U.S.C. §654(a)(1))was issued to respondent on November 11, 1975. A Notification of Proposed Penalty, issued the same date, proposes a penalty of $500.00. By timely Notice of Contest, respondent contested the alleged violation and proposed penalty.

The alleged violation was described in the citation as follows:

> "The employer failed to provide his employees working on a rotary drilling rig a place of employment which was free from recognized hazards that could cause death or serious physical harm to an employee in that a natural gas separator and vent line were not in operation to remove natural gas a safe distance from the rig area thus creating a fire and explosion hazard."

Section 5(a)(1) of the Act provides:

> "Each employer shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or likely to cause death or serious physical harm to his employees;"

## Jurisdiction and Issues

In its answer respondent generally denied all of the allegations of the complainant and specifically denied,

(1) the violation of section 5(a)(1) of the Act, (2) knowledge of, creation of, or responsibility for, any hazardous conditions, (3) that the alleged incident occurred at a respondent workplace, and (4) that it had any employees at the site of the incident that were not "servants loaned to the drilling contractor, drilling operator or others."

Respondent is a division of N L Industries employing approximately thirty-five hundred employees in every state where there is drilling activity and also overseas (Tr. 64-65). It is engaged in the sale and servicing of "drilling mud" and lease of related equipment to oil and gas well operators and drilling contractors. The materials constituting drilling mud come from "all over the country". On these facts respondent is found to be engaged in a business affecting interstate commerce, and jurisdiction, therefore, is conferred on this Commission.

At the hearing held at Oklahoma City on July 9, 1976, respondent stipulated to the reasonableness of the proposed penalty. Therefore, the only issues to be determined are:

(1) Whether Larry Boden, respondent's sales engineer, was an employee of respondent on October 10, 1975, within the meaning of the Act?

(2) If he was, did respondent violate section 5 (a)(1) of the Act on October 10, 1975?

## Findings of Fact

Upon the credible evidence of record the following facts are found; Proposed Findings of Fact submitted by the parties inconsistent therewith are denied:

1. Respondent is in the business of supplying materials and equipment to the drilling industry, primarily consisting of "drilling mud" and associated equipment.

2. Ladd Petroleum Company (hereafter Ladd) was the operator on a gas well located near Custer City, Oklahoma on October 10, 1975. E. W. Moran Drilling Company (hereafter Moran) was the drilling contractor and operated under a "day work" contract with Ladd. A drilling contractor usually performs under a "footage" or "day work" agreement with the well operator. Under a "footage" agreement the drilling contractor assumes responsibility for the overall drilling operations. When a "day work" agreement is in effect, the operator contracts for the use of the driller's rig equipment and his drilling crews on a 24 hour basis, and assumes responsibility for, and exercises control over drilling activities (Tr. 84-85).

3. Respondent, under a verbal agreement, was to furnish the drilling rig requirements for drilling mud on this well site to the operator, Ladd. The cost of the drilling mud to Ladd included the consultant services of a respondent Sales Engineer, Larry Boden.

4. Larry Boden who has been on respondent's payroll as an employee since 1973, had the sole duty under this agreement to make recommendations to Ladd as to the appropriate properties and density of the drilling fluid that should be maintained under the conditions encountered during drilling the particular well. Ladd's representative and drilling foreman, Al Fern, was in charge of the drilling operations at the well site and made all final decisions regarding the properties and density of the drilling mud to be used.

5. At all relevant times during his presence at the worksite in question, Larry Boden was under the direct supervision and control of Ladd with respect to his duties at the well site. Respondent did, however, retain sufficient control over Larry Boden to remove him from the well site.

6. Respondent customarily assigns a sales engineer to every well site to which it is supplying drilling mud. These sales engineers usually service 4 or 5 wells in a given geographical area on a daily basis. They are instructed by respondent to be informed of the progress of their customers' drilling operations, to check the condition of drilling mud, and offer assistance and advice whenever required and requested. Their visits to the well sites are virtually unsupervised by respondent. A sales engineer writes

daily reports concerning his activities and forwards them weekly to respondent's district manager. When a sales engineer requires information, or has questions, he contacts his immediate supervisor or district manager by way of the telephone or personal visits away from the well sites.

7. On or about October 1, 1975, Ladd encountered a large volume of gas prior to the time expected. At the time the gas was encountered the intermediate drill casing had not been set.

8. Larry Boden was notified that the well in question had received a "gas kick", which meant that the operation had struck a formation containing a large volume of pressurized gas, and that this gas was on its way up the drill hole toward the surface. He, in turn, notified respondent's district manager, Donald Cassel, and his immediate supervisor, George Strecker, who also is in the employ of respondent. Mr. Boden then went to the well site to offer his recommendations and suggestions to Ladd on how to best maintain circulation of the drilling mud and maintain sufficient hydrostatic pressure to keep the gas in the ground.

9. Upon being telephonically advised that Ladd had taken a "kick", respondent's district manager asked Larry Boden if they had a gas separator at the well site. He replied "Well, they're making one." The district manager then told Larry Boden that he might remind Ladd that if it

needs a separator respondent has them for lease. Larry Boden replied, "I already talked to them. I mentioned it to them."

10. The terms "gas separator" and "gas buster" are not terms of art and often times are used synonomously and interchangeably (Tr. 158-159). There are, however, technical differences between a commercial mud/gas separator and the type of fabricated separator in use on October 10, 1975, at the well site. Although both function to separate out the gas from the drilling mud, the non-commercial separator, a less sophisticated piece of equipment, is not usually a sealed unit, and separates the gas from the mud by gravity and the "lighter than air" principle. In this latter type of separator the gas is vented straight up into the air because there is insufficient pressure to vent the gas "to the side any distance". A commercial gas separator, on the other hand, is a sealed unit operating off of the pressure contained in gas and mud. This pressure forces the gas out of vent lines which can carry the gas a considerable distance away from the rig. These multiple vent lines also permit the operator to take advantage of the prevailing wind conditions when venting the gas.

11. In view of the experience and knowledge of respondent's district manager with respect to the drilling industry, it is reasonable to infer that he understood from the context of Mr. Boden's statements that a non-commercial mud/gas separator was to be used at the well site.

12. If gas separated from drilling mud is being vented a safe distance from the drilling rig, the failure to use a commercial mud/gas separator with a 40 to 50 feet vent hose is not a recognized industry-wide hazard in the petroleum and related industries.

13. On October 10, 1975, the drilling rig was equipped with a blow-out preventer to keep any gas encountered from blowing out of the bore hole, a choke line running from the rig to the reserve pit to be used to vent gas whenever necessary to relieve the pressure on the blow-out preventer, a mud/gas separator or "gas buster" fabricated by Moran employees on orders of Ladd to separate the gas from the mud, and a degasser customarily used for further separating out gas and air bubbles from the drilling mud. The fabricated mud/gas separator in use had a 8 foot vent line that vented the gas straight up into the atmosphere. The top of the vent line was approximately 12 to 15 feet above the ground. There was an absence of wind on October 10th, and the vented gas from the mud/gas separator was not being carried away from the drilling rig.

14. The fiery explosion which took place on October 10, 1975, and resulted in serious injury to Larry Boden and other persons at the well site, was caused by the ignition of gas vapors by reason of an exhaust on the

Swaco-Dresser diesel engine operating the degasser that was not equipped with a spark arrester. It is a customary safety practice in the drilling industry to have spark arresters installed on engines operating in the vicinity of drilling rigs.

15. At the time of the fire on October 10, 1975, respondent had only one employee, Larry Boden, at the well site. Supervisory personnel and employees of both Ladd and Moran also were present at the site.

16. Larry Boden, respondent's employee, had not reported to respondent's supervisory personnel for two days prior to the accident in question. He is a competent employee with wide knowledge regarding safety practices in the oil field, and petroleum related industries. He has been generally instructed by respondent that if the conditions at a drilling site become hazardous he should leave.

17. On October 10, 1975, the high volume of gas being separated from the fabricated mud/gas separator was not being vented a safe distance away from the drilling rig. Under the existing conditions, a reasonable and prudent man familiar with the drilling and related industries would have recognized that the failure to so vent the gas was hazardous.

18. The absence of a spark arrester on the Swaco-Dresser diesel engine on October 10, 1975, constituted a recognized hazard in the petroleum and related industries.

19. Respondent did not create or cause any of the conditions which resulted in the fire, or create or cause the recognized hazards referenced in Findings 17 and 18.

20. Respondent did not have knowledge of the conditions existing on October 10, 1975, at the well site which resulted in the fire, or knowledge of the conditions which constituted the recognized hazards referenced in Findings 17 and 18.

## Discussion

The citation alleging a "SERIOUS" violation of section 5(a)(1) of the Act (29 U.S.C. §654(a)(1) will be vacated.

This section, the so-called "general duty" clause of the Act, requires employers to discover and exclude from the workplace of the employees "[a]ll [feasibly] preventable forms and instances of hazardous conduct", Getty Oil Company v. Occupational Safety and Health Review Commission et al, No. 75-1828 (5th Cir; April 23, 1976), citing National Realty and Construction Co. v. OSHRC and Secretary, 489 F.2d 1257 & nn 34, 37 (D. C. Cir. 1973).

Unquestionably, the record contains substantial evidence that the drilling worksite in this case was not free of hazards likely to cause serious physical harm, even death on October 10, 1975, and that a reasonable and prudent employer familiar with oil drilling industry would have protected against the existing hazards.

Conducting drilling operations in the presence of a large volume of highly flammable gas is a universally-recognized hazard in the oil and gas drilling industry. That it is so recognized in this industry is shown on this record by the procedures and practices customarily followed in the industry and at this worksite. These include the use of a blow-out preventor with choke lines designed to vent the pressurized gas a safe distance away from the drilling rig and the strict enforcement of a no smoking ban at all well sites. Also, whenever mud/gas separators are employed, the gas is vented as far away from the rig as the equipment permits. Finally, it is standard operating procedure to install spark arresters on all motors operating in the vicinity of the wells.

The potential for serious physical injury, of course, is made plain by the serious burns resulting from the gas fire on October 10, 1975.

When drilling was resumed by Ladd on the morning of October 10, 1975, the mud/gas separator in operation was venting a large volume of highly combustible gas into the air in the vicinity of the well, and due to absence of any wind at that time,the gas remained in the rig area. In addition, the Swaco-Dresser diesel engine operating the

degasser was without a spark arrester. Obviously, these conditions were preventable by the simple expedient of terminating drilling operations until wind conditions were such as to remove the gas a safe distance from the well and a spark arrester was installed.

In defense, respondent relies in part on the common-law doctrine of the "borrowed employee"; and argues that it was not Mr. Boden's "employer" for purposes of the Act because it lacked control over the worksite and his activities.

The Commission recently stated in Secretary v. Gordon Construction Company, Docket No. 7390 (August 10, 1976), that the term "borrowed employee", is "a term of tort law and has no place in an administrative proceeding brought under remedial legislation designed to provide a safe place to work for every working man and woman in the nation." This decision, as well as previous decisions of the Commission, however, recognize that the question of whether a particular respondent is an "employer" is a crucial factor in determining his obligations and liability under the Act. According to the Commission, employment relationships for purposes of the Act must be defined on a case by case basis, considering both the economic realities of the situation and the remedial purposes intended by Congress. Secretary v. Gilles & Cotting Inc, 4 OSAHRC 1080 (1973), remanded on other grounds sub nom

Brennan v. Gilles & Cotting Inc., 504 F.2d 1255 (4th Cir. 1974).

The Commission has considered the following in identifying an "employer" for purposes of the Act: (1) the person whom the employees considered to be their employer; (2) who pays the employees their wages; and (3) who is responsible for controlling the employees activities. See Secretary v. Bayside Pipe Coaters Inc., Docket Nos. 1953 and 1974, 11 OSAHRC 751 (1974), and Secretary v. Weicker Transfer and Storage Company, Docket No. 1362, 15 OSAHRC 80 (1975).

Although both respondent and Larry Boden considered that the latter's activities at the well site were under the complete supervisory control of Ladd, Mr. Boden maintained both oral and written contact with this respondent's supervisors and apparently continued to receive his wages from respondent. Certainly, respondent also retained the power to remove him from the worksite should the circumstances warrant it. On those facts, this Judge is persuaded that the prerequisites of an employment relationship between respondent and Mr. Boden for the purposes of the Act have been satisfied.

The remaining question, therefore, is whether respondent on the facts of his record can be held responsible for a failure to furnish its employee, Mr. Boden, with a place of employment free of recognized hazards likely to cause serious physical harm, even death.

An employer is guilty of a "serious" violation of the Act for which a penalty can be assessed only if it knew or with the exercise of reasonable diligence should have known of the violation. Because it is undisputed that respondent did not have actual knowledge of the conditions constituting the recognized hazards, the sole question becomes whether Baroid could have discovered them by "reasonable diligence".

The economic realities of the situation here convince this Judge that the Act was not intended to require an employer, like respondent, to constantly scrutinize the equipment and work processes that are under another employer's complete control and away from the respondent's premises. To hold otherwise would be totally impracticable and an unreasonable burden. See generally, Secretary v. Conrad Precision Industries Inc., Hanovia Lamp Division, Docket No. 89, 2 OSAHRC 55 and 18 OSAHRC 154.

This does not mean, however, that an employer is relieved of his general duty to protect his employees if he has learned or should have learned of the presence of recognized hazards. But here the reports received from Mr. Boden by respondent's supervisory personnel did not place them on notice that recognized hazardous conditions existed or that the situation required respondent to visit and inspect the worksite. Baroid had placed a competent, well trained and knowledgeable employee on the site, and had always stressed to its employees, including

Mr. Boden, that they could leave any worksite if they felt endangered by the existing conditions. On the state of this record, respondent will not be held in violation of the 29 U.S.C. §654(a)(1).

## Conclusions of Law

1. Under the conditions existing on October 10, 1975, the well site in question was not "free" of "recognized hazards" as those terms are used in 29 U.S.C. §654(a)(1). The failure to vent the gas being separated from the drilling mud a safe distance away from the drilling rig and the use of a diesel engine without a spark arrester constituted "recognized hazards" in the petroleum and respondent's industries.

2. The complaint failed to prove by a preponderance of the evidence that respondent knew, or with the exercise of reasonable diligence should have known, of the existence of these recognized hazards on October 10, 1975.

3. The respondent was not in violation of 29 U.S.C. §654(a)(1) on October 10, 1975.

## ORDER

Based on the above findings of fact, conclusions of law, and the entire record, it is ORDERED:

The alleged "SERIOUS" violation of 29 U.S.C. §654(a)(1), and the proposed penalty based thereon, are hereby VACATED.

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR,<br>Complainant,<br>v.<br>E.I. DU PONT DE NEMOURS & CO., INC.,<br>Respondent. | OSHRC Docket No. 76-2400 |

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

This is a case under the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). A decision of Administrative Law Judge Joseph Chodes is before the Commission for review under section 12(j) of the Act, 29 U.S.C. § 661(i). In his decision, Judge Chodes affirmed items 18 and 21 in a citation issued by the Secretary of Labor ("the Secretary") alleging other-than-serious violations of the Act. 1/ The two items charged noncompliance with the standards at, respectively, 29 C.F.R. § 1910.94(c)(2) and 29 C.F.R. § 1910.151(c). Former Commissioner Barnako directed review of this case on the issues raised in the petition for discretionary review filed by Respondent, E.I. du Pont de Nemours & Co., Inc. The issues before us on review are:

---

1/ Respondent was issued a total of 15 citations for alleged violations at its Chambers Works facility in Deepwater, New Jersey. The only issues on review concern two of the 35 items in citation 1.

(1) Whether the judge erred in affirming the item alleging noncompliance with section 1910.94(c)(2) 2/ in the Pump Shop. More particularly, whether Respondent's spray painting operation was performed in a "spray room." 3/

(2) Whether the judge erred in affirming the item alleging noncompliance with section 1910.151(c) 4/ in the Analyzer Room. More specifically, whether the standard safety shower provided by Respondent was "suitable" for quickly flushing the eyes.

For the reasons stated below, we remand item 18 to a judge to determine whether the spray painting was done in a "spray room," and we vacate item 21 due to the Secretary's failure to prove that the shower provided was not suitable.

---

2/ The standard provides in pertinent part:

> Subpart C - Occupational Health and Environmental Control
> § 1910.94 Ventilation.
> * * *
> (c) Spray finishing operations -
> * * *
> (2) Location and application. Spray booths or spray rooms are to be used to enclose or confine all operations.

3/ 29 C.F.R. § 1910.94(c)(1)(iii) defines a "spray room" as follows:

> A spray room is a room in which spray-finishing operations not conducted in a spray booth are performed separately from other areas.

4/ The standard reads as follows:

> Subpart K - Medical and First Aid
> § 1910.151 Medical services and first aid.
> * * *
> (c) Where the eyes or body of any person may be exposed to injurious corrosive materials, suitable facilities for quick drenching or flushing of the eyes and body shall be provided within the work area for immediate emergency use.

I

A

Item 18 alleges noncompliance with section 1910.94(c)(2) in the Pump Shop, one of the buildings in the Central Crafts area of Respondent's Chambers Works facility, which was inspected by compliance officer Albert Smith of the Occupational Safety and Health Administration ("OSHA"). The shop was approximately 30 feet wide, 100 feet long, and 16 feet high, with fully enclosed offices and a lunchroom, which were only 8 feet high, at one end of the building. The rest of the building was the "work area," which was approximately 70 feet in length.

In the work area, nine of Respondent's employees reconditioned and repaired pumps, 5/ which were generally 2 feet by 3 feet in size. The regular work procedure for each of these nine employees, except when they were working on "submerged" pumps, was to recondition and repair a pump at the employee's individual work bench, then clean it in a caustic bath, and finally hang it on a chain hoist and spray it with a can of aerosol paint. The spray painting was done at or near the double door located midway along the 30-foot wide front of the building. At least one employee put his back to the door and sprayed towards the rest of the room. Each of the nine employees sprayed an average of two to five pumps a day for five days a week, with each pump taking two to five minutes to paint. At least two to three 13-ounce cans of spray paint were used in the Pump Shop each day. Usually, only one employee would be spray painting a pump at any given time, while the other eight would be repairing other pumps. The nearest bench where employees were repairing pumps was 20 to 30 feet from the spray painting operations. However, repair work on "submerged" pumps was performed at a distance of 10 feet or less from the spray painting area. One to

---

5/ A tenth employee who worked in the room only tested pumps. No further testimony concerning this employee's job was given.

five of these pumps were assigned to each of the nine employees every week. "Submerged" pumps were not sprayed.

The Pump Shop had a fan, which was located in the upper corner of one side of the building above the enclosed rooms and about 80 feet from the spray painting operations. On the day of the inspection, the fan was not in operation, and the windows along one side of the building and the double door at the front of the building were all closed. The fan was rarely used in the winter and was used only intermittently at other times. The doors and windows were not opened when the weather was cold. 6/

During his inspection of the Pump Shop, compliance officer Smith observed Gary Novotny, one of Respondent's Pump Shop mechanics, spray painting a pump that was hanging from a chain hoist in the work area near the front door. Smith smelled "pungent" vapors emanating from the paint, but he did not perform any test to determine the paint's toxicity. Respondent's employee Novotny testified that, when he repaired pumps at his work bench some 60 feet from the painting area while another employee was spray painting, he could taste the paint and smell its "nasty odor." He stated that the vapors from the paint got stronger as one walked toward the painting operation. Novotny testified that he was told by his foreman that a spray booth with its own exhaust fan had been provided at one time for the pump spraying operation, but it had been removed before Novotny began working in the Pump Shop.

Compliance officer Smith testified that a spray booth or spray room, where there is adequate mechanical or natural ventilation, should have been used to protect employees from the paint's toxic and flammable vapors. He testified

---

6/ Respondent's supervisor of the Pump Shop ambiguously testified, "There is a small fan also located inbetween (sic) two louvers on the south end of the shop, but, those louvers are blocked off so you do have that additional exhaust."

that a fan should have been located close to the point of the spray painting operation to prevent the vapors from reaching employees working at the nearby benches.

A penalty of $80 was proposed for the violation alleged in item 18, and Respondent's counsel stipulated that it was an appropriate amount if the violation were affirmed.

B

In his decision, Judge Chodes concluded that Respondent failed to comply with section 1910.94(c)(2) in that its pump painting operation was not enclosed or confined in a "spray booth," as defined in 29 C.F.R. § 1910.107(a)(3), 7/ nor in a "spray room," as defined in section 1910.94(c)(1)(iii). See note 3 supra. He determined that the "fairly large" work area in Respondent's Pump Shop, with its only powered ventilation being 80 feet from the painting operation, was not a "spray booth." He further concluded that the work area was not a "spray room" because the spray painting operation was not separated from the other pump repair activities that were being performed in the Pump Shop. The judge rejected Respondent's contention that, in accordance with Bethlehem Fabricators, Inc., 76

---

7/ The applicable standard provides in pertinent part:

> Subpart G - Occupational Health and Environmental Control
> § 1910.94 Ventilation.
>
> * * *
>
> (c) Spray finishing operations - (1) Definitions applicable to this paragraph -
>
> * * *
>
> (ii) Spray booth. Spray booths are defined and described in § 1910.107(a).

Section 1910.107(a)(3) defines a "spray booth" as follows:

> A power-ventilated structure provided to enclose or accommodate a spraying operation to confine and limit the escape of spray, vapor, and residue, and to safely conduct or direct them to an exhaust system.

OSAHRC 62/C2, 4 BNA OSHC 1289, 1976-77 CCH OSHD ¶ 20,782 (No. 7176, 1976) ("Bethlehem Fabricators"), the Secretary failed to prove a violation in that he did not sustain his burden of establishing that the vapors or other emissions from the spray paint were dangerous. Judge Chodes noted that in Bethlehem Fabricators an expert called by the employer testified that the paint vapors did not present a health hazard to employees. He distinguished the instant case on the basis that here no such rebuttal evidence was introduced. Moreover, the judge made a specific finding that the nine employees of Respondent "were exposed to dangerous quantities of flammable vapors and combustible residues." He based this finding on what he deemed to be reasonable inferences drawn from the testimony of compliance officer Smith and Respondent's employee Novotny. He thus affirmed item 18 and assessed the stipulated penalty of $80, which he found to be appropriate.

C

In its initial arguments on review, Respondent contended that the judge erred in finding that the nine employees were exposed to dangerous amounts of flammable emissions from the paint and in thus affirming item 18. Respondent maintained that the Secretary failed to meet his burden of proof under Bethlehem Fabricators in that he did not test for toxicity or flammability of the paint emissions. In response, the Secretary argued that Judge Chodes was correct in distinguishing Bethlehem Fabricators from the instant case and in thus affirming item 18.

However, in a supplemental memorandum filed while this case was pending on review, Respondent acknowledged that, after it filed its brief on review, the Commission issued its decision in Westinghouse Electric Corp., 79 OSAHRC 28/B8, 7 BNA OSHC 1318, 1979 CCH OSHD ¶ 23,542 (No. 13955, 1979), rev'd and remanded, 617 F.2d 497 (7th Cir. 1980) ("Westinghouse"). In that case, the Commission

held that section 1910.94(c)(2) requires that all spray finishing operations within its scope be enclosed or confined by spray booths or spray rooms without regard to whether emissions are present in dangerous amounts. Noting that in Westinghouse the Commission expressly overruled that portion of Bethlehem Fabricators upon which Respondent had relied in its initial arguments on review, Respondent set forth other contentions in support of its continuing argument that Judge Chodes' decision should be reversed. Accordingly, we conclude that the following contentions are the issues now before us on review.

Respondent asserts that the spraying area in its Pump Shop conformed to the definition of "spray room" in section 1910.94(c)(1)(iii) because the spray painting of the pumps was "performed separately from other areas," i.e., it was done 20 to 30 feet from the area where employees were repairing pumps and even further from the lunchroom and offices, which were completely enclosed by 8-foot high walls and a ceiling. Respondent notes that section 1910.94(c)(1)(iii) does not specify a minimum distance of separation, and it asserts that the Secretary failed to prove that the spray painting was not "performed separately from other areas" within the meaning of that definition. According to Respondent, because each of the nine employees who were repairing pumps also spray painted pumps at some time each day, those employees were not unnecessarily exposed to emissions to which they otherwise would not have been subjected. Respondent further contends that the Secretary did not offer any proof that Respondent had not complied with the design or mechanical specifications for spray rooms, e.g., section 1910.94(c)(4)(iii), which requires the air in the breathing zone of the operator to be maintained at a certain level. Noting that no penalty was imposed by the Commission in Westinghouse, Respondent additionally argues that, if the Commission "retroactively applies" Westinghouse and finds a violation in the instant case, it should not assess any penalty due to the lack of proof that

Respondent's employees were exposed to dangerous quantities of flammable vapors and combustible residues.

D

As stated by Respondent in its supplemental memorandum, the Commission concluded in Westinghouse, supra, that section 1910.94(c)(2) requires that all spray finishing operations within its scope be enclosed or confined by spray booths or spray rooms without regard to whether emissions are present in dangerous amounts. 8/ In that case, the Commission noted that the room in which the spray painting was done measured approximately 200 feet long, 80 feet wide, and 100 feet high and that there was no physical separation of the spray finishing area from other production activities, which were performed as close as 5 feet from the spray finishing operation. The Commission noted that a spray room is a room where spray painting is done "with adequate physical separation from other areas," and that the requirement in 29 C.F.R. § 1910.107(b)(8) that spray booths be removed at least 3 feet from other operations "does not indicate that spray rooms may be separated from other areas by as little as 3 feet." Westinghouse, supra, 7 BNA OSHC at 1323 n.14, 1979 CCH OSHD at p. 28,521 n.14. Based on the facts above, the Commission concluded that Westinghouse's spray finishing operation was not enclosed or confined by a spray room.

On appeal from this decision, the United States Court of Appeals for the Seventh Circuit concluded that section 1910.94(c)(2) does not necessarily require a physical barrier between spray painting operations and other activities but rather, by using the term "room," the standard "suggests that activities other than spray painting may be in the same general room provided the spray painting

---

8/ Accordingly, we need not determine in this case whether the judge erred in finding that the employees were exposed to "dangerous quantities" of flammable vapors and combustible residues. The finding is set aside because it is immaterial to the alleged violation.

is sufficiently separated from any other activities so that the spray painting causes no interference." Westinghouse Electric Corp. v. OSHRC, 617 F.2d 497, 502 (7th Cir. 1980). The court stated, "The record was not developed for the purpose and is not sufficient to support a determination of whether or not the location of the Westinghouse spray painting is sufficiently separated from other activities in the particular circumstances so as to qualify as being conducted in a spray room." 617 F.2d at 503 [footnote omitted]. Therefore, the court vacated the Commission's order and remanded the case for a determination of whether the spray painting was performed in a "spray room."

Noting that the court's decision required that the parties be afforded the opportunity to present further evidence on the separation of Respondent's spray finishing operations from other activities, the Commission, on remand from the court, further remanded the case to the judge who had initially heard the case to determine whether the spray painting was performed in a "spray room." Westinghouse Electric Corp., 80 OSAHRC 120/G1, 9 BNA OSHC 1183, 1981 CCH OSHD ¶ 25,004 (No. 13955, 1980).

As in Westinghouse, the record in the instant case was not developed for the purpose of determining whether the spatial separation between Respondent's spray painting operations and other activities in the Pump Shop was sufficient to meet Respondent's duty to provide a "spray room." Indeed, because this case was tried before the various decisions in Westinghouse were issued, the parties were not clearly on notice that the absence of a physical barrier is not determinative on this issue. We therefore must give the parties the opportunity to introduce evidence relevant to the spatial or physical separation of Respondent's spray finishing from other activities. Accordingly, we remand this case to the Chief Administrative Law Judge for assignment to an administrative law judge 9/

---

9/ Administrative Law Judge Joseph Chodes, who initially decided this case, has since retired.

for the purpose of conducting further proceedings consistent with this decision, including providing the parties an opportunity to present additional evidence as to whether Respondent's spray painting was performed in a "spray room" within the meaning of section 1910.94(c)(1)(iii) and entering a finding on this issue.

II

A

Item 21 relates to conditions observed by OSHA compliance officer Vincent Gallagher during an inspection of the Analyzer Room in the Chemical Building of Respondent's Chambers Works facility. The room was a laboratory measuring 17 feet by 30 feet in which employees analyzed the industrial waste water generated by the plant to determine if it had been treated properly before its release into the Delaware River. Analysis of the waste water involved the use of various corrosive chemicals, including sulfuric acid. The corrosive chemicals, which were stored in bottles and then placed in secondary containers, were used continually every day, but only in small quantities. At least one employee was in the room when the inspection was conducted. A "standard safety shower" 10/ was the only means provided in that room for drenching the body and flushing the eyes. An employee in that room would always be no further than 30 feet away from that shower. When the handle of the standard safety shower was pulled down completely, the shower operated at a pressure of 35 pounds per square inch at its head, with the flow pressure being somewhat less on the user's face. In item 21, the Secretary alleged that an eyewash fountain was required under section 1910.151(c), but not provided, and proposed a penalty of $135.

At the hearing, compliance officer Gallagher testified that he and Harry Allendorf, the OSHA Area Director, both interpreted the cited standard to require

---

10/ This "standard safety shower" was an overhead, full-body shower operated by pulling a handle to start the flow of water from the shower head.

an eyewash fountain because, in their view, the standard shower was not a "suitable facility" for flushing eyes. Gallagher noted that no directives concerning the interpretation of section 1910.151(c) had been issued by the Secretary. However, Gallagher expressed his opinion, concerning flushing corrosive chemicals from the eyes, that "[i]t's normal first-aid emergency procedure to wash the eye for fifteen minutes with a gentle flow of water." Gallagher testified that he believed an eyewash fountain in the Analyzer Room was necessary because, with only the full body shower immediately available, if a small quantity of acid got into an employee's eyes, flushing it out would involve holding the "head in an upright position for fifteen minutes" while standing under the shower. Gallagher pointed out several drawbacks to such flushing methods. He stated that employees, besides probably being reluctant to get themselves completely drenched just to wash out their eyes, would have difficulty breathing with their heads held "in an upright position for fifteen minutes" under the shower. According to Gallagher, employees not wishing to get entirely wet "may elect to go into the men's room or other source of water" where they would not be able to get the required quantity of water from the basins or spigots to adequately flush their affected corneas.

In response, James Bowman, Senior Safety Supervisor for the Chambers Works plant, testified that employees working in the laboratory are required to wear "standard side shield safety glasses" that are issued to them by Respondent. He stated that, in addition to such glasses, employees are required to wear "slash proof goggles or face shields" when working with corrosive materials. Nevertheless, he noted that Respondent recognizes the possibility of some chemical getting into a person's eyes even while that person is wearing the eye protection. Bowman expressed his opinion and Respondent's position that the shower provided is a suitable facility for the quick flushing of eyes. With regard

to how an employee could flush the eyes with the shower, Bowman testified, "The shower would be operated by pulling the waiting handle . . . . The water would run down his face and run through his eyes. He could tilt his head back and the water would go through his eyes or he could cup his hands and flush the water up into his face." He further stated that the flow of the shower was a maximum of 35 pounds per square inch. He also noted his company's policy that any employee who gets corrosive material on himself or herself should be transported to the medical division as soon as possible. Bowman testified that Respondent has no history of eye injuries in the Analyzer Room.

B

Judge Chodes concluded in his decision that, by not providing an eyewash fountain in the Analyzer Room, Respondent did not comply with section 1910.151(c). He noted that the cited standard refers separately to the eyes and body, and that "the eyes need special consideration due to their vulnerability to injury, and the dire consequences which could result from contact with corrosive material." He determined that the standard full-body shower was not a "suitable facility" under section 1910.151(c) for "immediate emergency use" for "quick drenching or flushing" of the eyes because it did not permit the application of water directly to the eyes, but rather supplied only diffused water. The judge noted several unreviewed judges' decisions that Respondent cited in its post-hearing brief for the propositions that an eyewash fountain is not required under the standard and that other methods of supplying water are suitable. However, he distinguished the instant case from those cases on the ground that in each of those cases the water supplied for flushing the eyes was not diffused. Judge Chodes thus affirmed item 21 and assessed the proposed penalty of $135.

Respondent argues on review that the shower provided in the Analyzer Room was a "suitable" facility for flushing the eyes. For support, Respondent cites

Gibson Discount Center, Store No. 15, 78 OSAHRC 30/C1, 6 BNA OSHC 1526, 1978 CCH OSHD ¶ 22,669 (No. 14657, 1978), and Gulf Oil Co., 77 OSAHRC 216/B10, 6 BNA OSHC 1240, 1978 CCH OSHD ¶ 22,737 (No. 14281, 1977), as well as numerous unreviewed judge's decisions determining whether certain sources of water were "suitable facilities" under section 1910.151(c). It asserts that the shower it provided is just as "suitable" as an eyewash fountain. Respondent also cites to the evidence in the record concerning the alternative precautions it took to protect the eyes of its employees. Respondent further contends that the term "suitable" in section 1910.151(c) is so vague as to render the standard unenforceable and invalid. The Secretary contends on review that, for the reasons stated by the compliance officer at the hearing and by Judge Chodes in his decision, the shower provided in the Analyzer Room was not a suitable facility for quick drenching of the eyes within the meaning of section 1910.151(c).

C

In Gibson Discount Center, supra, and Gulf Oil Co., supra, the Commission determined that the issue of whether facilities are "suitable" under section 1910.151(c) depends on the particular circumstances of the case, including such factors as the nature and amount of the material to which the eyes are exposed and the distance between the work area and the washing facility. Therefore, we agree with Respondent that more than one type of eyewash facility may be suitable. The issue before us is not whether Respondent is required to provide an eyewash fountain but rather whether the shower provided is suitable under the circumstances.

We conclude, on the basis of the record before us, that the Secretary has failed to meet his burden of proving that the shower provided by Respondent was not suitable. 11/ The only evidence regarding the configuration and operation

---

11/ In light of this disposition, we need not rule upon Respondent's contention that the standard is unenforceably vague.

of the shower put forth by compliance officer Gallagher was his testimony that the shower flowed from overhead and that employees would have to hold their heads "in an upright position for fifteen minutes" to use it to flush out their eyes. Gallagher testified that he did not remember what the Analyzer Room looked like nor where the shower was located in the room. Moreover, he testified on cross-examination that the safety shower would be "one of the methods that an employee may use to get a corrosive out of his eyes" and that the shower was there to provide water for quick drenching as a first aid measure. He further stated, "I don't think there would be anything to prevent an employee from drenching his eyes with that shower." Gallagher also testified that he made no effort to determine at what pressure the shower flowed. Consequently, the Secretary offered no evidence that the flow of the shower could not be moderated to produce a gentle stream. In addition, the Secretary does not contend that the shower was so located that employees could not reach it without unreasonable delay even if they were working at the maximum distance of 30 feet from the shower.

It was Respondent's witness Bowman who testified that, according to his measurement, the shower flowed at a maximum pressure of 35 pounds per square inch. However, Bowman did not testify concerning the full range of the shower's flow rate. Bowman's testimony provided the only further description of the shower--that it was operated by pulling a handle.

Accordingly, we conclude that the judge erred in affirming item 21. 12/ We hold that the Secretary failed to prove that the shower provided by Respondent

---

12/ In affirming the item, the judge relied primarily on the fact that the shower supplied only diffused water. However, there is no foundation in the record for a finding that a facility cannot be suitable if it supplies diffused water.

was not suitable, and that the Secretary therefore did not establish that Respondent failed to comply with section 1910.151(c). For this reason, we vacate item 21.

III

Accordingly, we remand this case to the Chief Administrative Law Judge for assignment to an administrative law judge for the limited purpose of conducting further proceedings on item 18, which alleges noncompliance with section 1910.94(c)(2), including entering findings of fact and conclusions of law consistent with this opinion. We vacate item 21, which alleges noncompliance with section 1910.151(c), as well as the penalty proposed therefor.

IT IS SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: JAN 29 1982

CLEARY, Commissioner, concurring in part and dissenting in part:

I join in Part I of the lead decision, remanding item 18 for a determination of whether Respondent's spray painting operation was performed in a "spray room." However, I dissent from the majority's decision to vacate item 21. I conclude that the standard safety shower provided by Respondent was not a suitable facility for use by employees to wash corrosive chemicals out of their eyes and that Respondent therefore failed to comply with 29 C.F.R. § 1910.151(c). 13/

As noted by the majority, both the compliance officer and the area director testified that an eyewash fountain should have been provided because the standard safety shower was not "suitable" for flushing corrosive chemicals from the eyes. In support of his opinion, compliance officer Gallagher gave unrebutted testimony that "[i]t's normal first-aid emergency procedure to wash the eye for fifteen minutes with a gentle flow of water." In contrast, the standard safety

---

13/ I reject Respondent's contention that § 1910.151(c) is unenforceably vague. Section 1910.151(c) is not vague on its face because, given the wide variety of situations in which the eyes or a part of the body may come into contact with various corrosive materials, the standard was drafted "with as much exactitude as possible in light of the myriad conceivable situations which could arise and which would be capable of causing injury." See Ryder Truck Lines, Inc. v. Brennan, 497 F.2d 230 at 233 (5th Cir. 1974).

Furthermore, the standard is not vague as applied to the facts of this case. In mentioning the "eyes" separately from the rest of the "body" in two instances, section 1910.151(c) gives notice that facilities that are suitable for drenching the body may not be suitable for flushing the eyes. In addition, it is a matter of common understanding that, as stated by Judge Chodes, "the eyes need special consideration due to their vulnerability to injury, and the dire consequences which could result from contact with corrosive material." I therefore conclude that the standard provides "a reasonable warning of the proscribed conduct in light of common understanding and practices." See Ryder Truck Lines, Inc. v. Brennan, 497 F.2d at 233; see also Brennan v. OSHRC (Santa Fe Trail Transport Co.), 505 F.2d 869 (10th Cir. 1974). In fact, as the Secretary correctly notes, Respondent provided eyewash fountains in some of its other chemical-manufacturing facilities, thereby indicating recognition on its part that such facilities are suitable for protection of employees working with corrosive chemicals.

shower provided by Respondent operated at a maximum force of 35 pounds per square inch, considerably more pressure than a gentle flow. Nor is there anything in the record to indicate that employees with corrosive chemicals in their eyes could reduce this to a gentle flow. Employees seeking to use the shower to flush corrosive chemicals out of their eyes would suffer discomfort, if not harm, from the considerable pressure of the water flowing onto their eyes. In fact, it seems doubtful that employees could hold their eyes open for the 15 minutes required to adequately flush their eyes, considering the force of the shower. Employees cupping their hands for water to rinse their eyes, to avoid the force of the water from the shower head onto their eyes, would probably be unable to create a constant flow of water over their eyes. The record does not clearly establish that employees could rinse their eyes by cupping their hands, because it does not disclose whether the shower remains in operation if the handle is released. Moreover, employees using these facilities would get their whole bodies wet from the overhead shower. Not wishing to get entirely wet just to flush their eyes, employees could lose valuable time seeking other sources of water and would find those alternative sources inadequate for flushing their eyes. In my view, Respondent essentially admitted that the shower was not suitable when it stated in its submissions on review: "Indeed, common sense dictates that an adult who stands under a shower which provides 35 pounds of pressure at the head, would be subjected to a rather forceful and concentrated rush of water in the area of his eyes."

I agree with Judge Chodes that the unreviewed judge's decisions cited by Respondent are not controlling in this case, see Leone Construction Co., 76 OSAHRC 12/E6, 3 BNA OSHC 1979, 1975-76 CCH OSHD ¶ 20,387 (No. 4090, 1976), and that the cases are distinguishable on the ground tnat they did not involve facilities providing diffused water. I also agree with the judge that a facility

supplying only diffused water is not a suitable facility for quickly flushing the eyes, an operation requiring a "flow of water" rather than a spray of water in order to successfully wash out any corrosive chemical.

Accordingly, I dissent from the majority's refusal to affirm item 21.

Chodes, Judge

## I. STATEMENT OF THE CASE

This is a proceeding pursuant to section 10 of the Occupational Safety and Health Act of 1970 (29 U.S.C. §651, et seq., hereinafter referred to as the Act), in which the respondent is contesting citations issued by the complainant against the respondent under the authority vested by section 9(a) of the Act. The citations which were issued on May 6, 1976, alleged that on the basis of an inspection made April 5-22, 1976, of a place of employment located at the respondent's Chambers

Works, Deepwater, New Jersey, the respondent allegedly violated the Act by failing to comply with certain occupational safety and health standards promulgated pursuant to section 6 of the Act (29 U.S.C. §655).

Specifically, respondent was issued Citations Nos. 1 through 15. On May 28, 1976, respondent filed with complainant a notice of intention to contest only the following citations and items:

Citation #1

item No. 2(a)
item No. 7(b)
item No. 9
item No. 15(a) and (b)
item No. 18
item No. 19(a) and (b)
item No. 20(h)
item No. 21
item No. 26

Citation #2, item 1(a) and (b)

Citation #3, item 1(b)

Citation #5, item 1

Citation #7, item 1

Citation #8, item 1

Citation #9, item 1

Citation #12, item 1(b) and (c)

Citation #13, item 1

Citation #14, item 1(a) through 1(g)

Citation #15, item 1

Under the provisions of section 10(a) of the Act, 29 U.S.C. §659(a), the citations and items not contested became the final order of the Commission and are not involved in this proceeding.

The parties have entered into a "Stipulation Amending Complaint" and a "Stipulation Order" which dispose of all contested citations and items excepting the following:

Citation No. 1, item 2(a)
Citation No. 1, item 7(b)
Citation No. 1, item 15(a) and (b)
Citation No. 1, item 18(a)
Citation No. 1, item 20(h)
Citation No. 1, item 21
Citation No. 12, items 1(b) and (c)
Citation No. 13, item 1

The stipulations which are on file as part of the record in this case are approved.

The case was tried on May 4 and 5, 1977, in Philadelphia, Pennsylvania.

At the start of the hearing, complainant moved to withdraw item 20(h) of Citation No. 1 for violation of 29 C.F.R. §1910.132(a) on the grounds that a reevaluation of the facts indicated that a prima facie case could not be established. The motion is granted.

The alleged violations which were contested at the hearing will be discussed below in the order presented at the hearing.

## II. CITATION NO. 1, ITEM 2(a) -- ALLEGED VIOLATION OF 29 C.F.R. §1910.22(a)(2) 1/

This item alleged that floors in D Building Chemical Area were not maintained in a dry condition. The proposed penalty was $75.

---

1/ The standard provides:

> The floor of every workroom shall be maintained in a clean and, so far as possible, a dry condition. Where wet

The only witness who had personal knowledge of this alleged violation was John Holsch. Complainant did not inform respondent prior to the hearing that Mr. Holsch would testify regarding this violation as required by prehearing instructions to the parties, nor was the fact that Mr. Holsch would testify in support of the alleged violation disclosed to the respondent in prehearing depositions taken by the respondent. Respondent represented that it was not prepared to deal with Mr. Holsch's testimony and would be prejudiced if he were allowed to testify. Since the only evidence complainant was prepared to present, other than the testimony of Mr. Holsch, was hearsay evidence by the compliance officer who had not observed the alleged violation, the item was vacated (Tr. I-29).[2/]

## III. CITATION NO. 1, ITEM 18 -- ALLEGED VIOLATION OF 29 C.F.R. §1910.94(c)(2)[3/]

### A. Summary of Evidence

This item alleges that a spray booth or spray room was not used to enclose or confine spray-finishing operations.

---

1/ (Footnote cont'd.)

> processes are used, drainage shall be maintained, and false floors, platforms, mats or other dry standing places should be provided where practicable.

2/ The transcript of the hearing held on May 4, 1977, is referred to as Tr. I and of the hearing held on May 5, 1977, as Tr. II.

3/ Under the general heading "Ventilation" and the sub-heading "Spray finishing operations," the standard, provides:

On April 6, 1976, Albert Smith, one of the complainant's compliance officers, inspected the Pump Shop in the Central Crafts Building, an area of about 30 feet by 100 feet. The shop was divided by 8-foot high partitions into a work area and enclosed offices and lunchroom. The work area, depicted in photographic exhibits R-2a and 2c, was ventilated by a fan located about 80 feet from the work area that was capable of changing the air about every 2-1/2 minutes. The fan was operable by a switch readily available to employees. However, the fan is rarely used in the wintertime and is used intermittently at other times. Ventilation was also achieved through two doors in the shop and windows on one side of the building. Here again, the doors and windows were not open when the weather was cold. (Tr. I-31, 57, 62, 78, 85, 89, 94, 98, 99, 101.)

Normally, seven to ten employees worked in the Pump Shop reconditioning and repairing pumps. Mr. Smith, the compliance officer, observed one employee spraying a pump about two or three feet in size, using an aerosol can of paint weighing 13 ounces, made by Spray Products Corporation. On a "heavy" day, an employee could spray five pumps and use two cans of the spray. Mr. Smith noted that the paint vapors were pungent and that in his opinion the paint was extremely flammable. An employee of respondent testified that the paint had a "nasty odor and

---

3/ (Footnote cont'd.)

> LOCATION AND APPLICATION. Spray booths or spray rooms are to be used to enclose or confine all operations. Spray-finishing operations shall be located as provided in sections 201 through 206 of the Standard for Spray Finishing Using Flammable and Combustible Materials, NFPA No. 33, 1969.

the worst part of it was that you tasted the paint" and that paint particles got into his mouth. In the actual spraying area "it was worse." (Tr. I-31, 32, 39, 62, 66, 83.)

Nine of the employees working in the Pump Shop did spray painting, one at a time. A spray operation takes up to five minutes to complete and is done in the center of the shop about 20 to 60 feet from where the other employees are working, although sometimes employees got to within five feet of the spray area. (Tr. I-38, 39, 65, 77, 81.)

Mr. Smith recommended that a citation be issued because a flammable material was being used outside of a spray room or booth in an atmosphere that was not ventilated and there was a possibility that the toxic material and vapor could be detrimental to the employees, plus possible flammability. It was Mr. Smith's opinion that there should have been adequate ventilation to remove flammable vapors and that this should have been accomplished by having the spray painting done in a spray room or booth that had adequate ventilation to remove flammable vapors. (Tr. I-32, 35.)

Mr. Smith proposed a penalty[4/] of $80 which respondent stipulated was appropriate in the event that a violation was established (Tr. I-36).

---

4/ Section 17(j) of the Act (29 U.S.C. §666(i)) provides:

> The Commission shall have authority to assess all civil penalties provided in this section, giving due consideration to the appropriateness of the penalty with respect to the size of the business of the employer being charged, the gravity of the violation, the good faith of the employer, and the history of previous violations.

## B. Discussion

The evidence establishes that the spray finishing operation conducted in the Pump Shop was not in a "spray booth" which is defined in §1910.107(a)(3) as "[a] power ventilated structure provided to enclose or accommodate a spraying operation to confine and limit the escape of spray, vapor, and residue, and to safely conduct or direct them to an exhaust system." Here the spraying was done in a fairly large room with the only power ventilation located about 80 feet from where the spraying was carried on. Nor was the operation carried on in a "spray room" defined in §1910.94(c)(1)(iii) as "a room in which spray-finishing operations not conducted in a spray booth are performed separately from other areas." In the instant case, the spraying operation was not separated from where the other work of repairing parts was being done in the Pump Shop.

It is the position of the respondent that the complainant has failed to prove a violation of the standard because he has failed to prove the dangerous nature of the vapors or emissions emanating from the spraying operations. The case of Secretary v. Bethlehem Fabricators, Inc., 76/62/C2, 4 OSHC 1289, Docket No. 7176 (1976) is cited as authority for vacating the citation. In that case the standard allegedly violated was identical to the standard in issue herein. In the lead opinion, Chairman Barnako held that the standard involved herein, §1910.94(c)(2), should be construed together with §1910.107(d)(2) which contained a qualifying phrase providing that mechanical ventilation was required "so that life or property is not endangered" and §1910.107(a)(2) which

defines a spraying area as: "[a]ny area in which dangerous quantities of flammable vapors or mist, or combustible residues, dusts, or deposits are present due to the operation of spraying processes."

The Bethlehem Fabricators case is not considered to be a binding precedent inasmuch as in that case there was direct evidence from a hygienist who testified on behalf of the employer that tests conducted indicated that the vapors in the atmosphere did not present a hazard to the health of employees. No such testimony was presented in the instant case. The testimony of the compliance officer was that the vapors were pungent and extremely flammable and one of respondent's employees testified that the paint had a nasty odor and you could taste it. This testimony was not contradicted by the respondent. Absent contrary evidence, it is considered a fair inference that dangerous quantities of flammable vapors and combustible residues were present due to the spraying operations. Moreover, the Commission recently held in Secretary v. Gene L. Willison, d/b/a Gene L. Willison, Contractor, Docket No. 13603 (7-25-77) that the existence of a hazard may be presumed where there is noncompliance with the requirements of a standard.

Respondent also cites Secretary v. Eagle-Picher Industries, 74/63/E1, 2 OSHC 3124, Docket No. 4922 (1974). However, the case is distinguishable from the instant case because the respondent in that case was cited for violation of a different standard, namely, 29 C.F.R. §1910.107(a)(2) for spraying outside of predetermined areas. Although the question of the presence of "dangerous quantities of flammable vapors or mists, or combustible residues, dusts or deposits" was referred to in

the decision, Judge Duvall found that the "Respondent did in fact conduct its spray painting in predetermined areas," and this was the basis for dismissal of the citation.

C. Findings of Fact

1. Respondent did not use spray booths or spray rooms to enclose or confine spray-finishing operations carried on in the Pump Shop, Central Crafts Building.

2. Nine employees of the respondent were exposed to dangerous quantities of flammable vapors and combustible residues.

3. Respondent knew, or with the exercise of reasonable diligence, could have known of the presence of the violation.

4. Giving due consideration to size of the respondent's business, the gravity of the violation, the good faith of the respondent and the history of previous violations, it is determined that the stipulated penalty for the violation of $80 is appropriate and not repugnant to the purposes of the Act. (Secretary v. Thorleif Larsen & Sons, Inc., 74/74/C8, 130 OSAHRC 313 (1974).)

IV. CITATION NO. 12, ITEMS 1(b) AND (c) -- ALLEGED VIOLATION OF 29 C.F.R. §1910.212(a)(3)(ii)[5/]

A. Summary of Evidence

The contested items 1(b) and (c) of the citation allege that two "Bertsch" forming rollers were not guarded at the point of operation

---

5/ The standard provides:

> The point of operation of machines whose operation exposes an employee to injury, shall

to prevent an employee from having any part of his body in the danger zone during the operating cycle.

On April 6 and 7, 1976, Mr. Smith, the Compliance Officer, inspected the "old plate shop" where he observed a forming roller 16 inches in diameter and 10 feet long (Serial No. 6829) and another forming roller 8 inches in diameter and 6 to 8 feet long (Serial Number 7351).[6/] The rollers were used to shape large metal plates into cylindrical shapes for use in the fabrication of retaining tanks for water and chemicals. When the plates are heavy they are fed into the machine with a crane. The "point of operation" is where the rollers meet. There was no guarding on the machines. During the operation of the machine the operator's hands come within a foot or two of the machines. (Tr. I-104-106, 108, 109, 125, 145, 161.)

---

5/ (Footnote cont'd.)

> be guarded. The guarding device shall be in conformity with any appropriate standards therefor, or, in the absence of applicable specific standards, shall be so designed and constructed as to prevent the operator from having any part of his body in the danger zone during the operating cycle.

At the hearing (Tr. I-116-119) respondent raised the question of the validity of the standard on the grounds that the standard was not properly adopted, citing as authority the case of Secretary v. Parr, Inc., 76/76/A2, 4 OSHC 1449, Docket No. 9352 (1976). That decision by Judge Watkins was overruled by the Commission in Secretary v. Western Steel Manufacturing Co., 76/44/C11, 4 OSHC 1107, Docket No. 3528 (1976).

6/ The rollers are depicted in Exhibits C-1 and C-2.

The larger roller had a deadman's switch which required the operator to depress a button to make the rolls turn. Upon release of the button, the rolls stopped turning. Mr. Smith did not consider the deadman control sufficient protection because it takes two men to operate the machine and the operator cannot see whether the man on the other side of the machine is in the danger zone. The smaller roller, which did not have a deadman's switch, was controlled by a trolley switch. To start the roller, the operator turned the switch to the right or left depending on whether the rollers were to go forward or in reverse. With the switch in the center, the machine is in a stop position. Safety rules of the respondent require the operator not to leave the switch while the machine is running, but if there was no one at the switch, it would take five or six seconds to shut the machine off in the event that an employee got entangled. (Tr. I-134, 145, 146, 161, 170, 171.)

The hazard presented by the operation of the rollers is the possibility that someone could inadvertently get his hand into the point of operation and, should this happen, the hand and possibly the arm could be crushed (Tr. I-109).

The testimony of witnesses for complainant and respondent establish that guarding of the point of operation would not be feasible on either machine because such guarding would make it impossible for the machines to do their work (Tr. I-111, 112, 131, 162, 163). However, Mr. Smith testified that there were available other methods of guarding which could protect the operator and yet not interfere with the oper-

ation of the machines.[7/] One such device was an electrical pressure-sensitive pad in front of the points of operation on the machines which would shut off the machine if an employee got near the point of operation. (Tr. I-120, 121.)

J. M. Burkhart, respondent's superintendent with responsibility for the operation of the Central Crafts Division which included the shop where the Bertsch rollers involved herein are located, testified that the rollers had been in the shop for at least 30 years without an accident. It was Mr. Burkhart's opinion that a barrier guard would make it impossible to get heavy sheet metal or plate metal into the machine (Tr. I-164). He was also of the opinion that a trip or treadle would not diminish injuries to the hand or body as compared to the method of operation utilized by the respondent. With respect to an electronic guard, Mr. Burkhart testified that the movement of the plate could trip the machine out while the plate was being fed into the machine. (Tr. I-165, 168.) Also, the electronic beam would have to be placed very close to the machine to keep it from being tripped. It was Mr. Burkhart's opinion that the deadman's switch offered better protection than would an electric beam. (Tr. I-162, 167.)

---

7/ Respondent objected to the admission in evidence of any testimony relating to types of guarding other than guarding of the point of operation. The testimony was received pending a reserved ruling on the admissibility of the evidence. The testimony is considered relevant, respondent's objection is overruled and the testimony is received in evidence.

## B. Discussion

Respondent is charged with failure to guard the point of operation of two Bertsch rollers. Since physical guarding of the point of operation would prevent the machines from functioning, a violation of the standard cannot be predicated upon the failure to erect such guarding. Secretary v. Dic-Underhill, a Joint Venture, Docket No. 2232, 75/35/F10, 2 OSHC 1651 (1975). The inquiry then is whether other methods of guarding are available which would guard against injury and at the same time not prevent the machine from operating.

The methods utilized by respondent to control the operation are a deadman's switch for one machine and a trolley switch for the other. The deadman's switch completely protects the operator because if he takes his hand off the switch, the machine stops. However, it is possible that the person working with the operator could be in a dangerous position and yet not be seen by the operator in time to stop the machine and prevent injury. To this extent, the deadman's switch is not a complete safety device, albeit no accidents have occurred over the years.

The trolley switch controls operation of the machine with a lever and the respondent's safety rules require that the operator not leave the switch while the machine is operating so that, if necessary, the machine could be stopped by a flick of the switch. This method of controlling the machine is not foolproof because the operator could leave the switch while the machine is in operation.

It may, therefore, be conceded that a method of guarding other than a physical guard should be utilized if available and feasible.

The complainant's compliance officer recommended use of an electronic beam to stop the machine when an employee got into the danger zone of the machine. However, respondent's superintendent testified that an electronic beam could stop the machines when the metal plates were being positioned for feeding into the rollers and that the methods now being used to operate the machine imposed less hazard to employees than would be the case if an electric beam were installed. Testimony concerning the possible utilization of trip or treadle devices indicated that their use would not diminish injuries to employees. This testimony was not contradicted. To require respondent to install guarding methods which could interfere with the machines' function or increase the hazard to employees would not serve the purposes of the Act, particularly in light of the accident-free record of the machines over the years. Commissioner Cleary, in Secretary v. Industrial Steel Erectors, Inc., Docket No. 703, 74/2/E5, 1 OSHC 1497 (1974) stated that "[e]mployers and employees alike should not be required to comply with a standard so sedulously as to follow a course of conduct that is shown by the weight of the evidence to be less safe than an existing work practice."

C. Findings of Fact

A preponderance of the evidence supports the following findings of fact:

1. The operation of Bertsch forming roller (No. 6829) is controlled by a deadman's switch and the operation of Bertsch forming roller (No. 7351) is controlled by a trolley switch.

2. The machines have been in operation at least 30 years without an accident.

3. Physical guards to prevent exposure to injury at the point of operation of the Bertsch forming rollers would prevent the machines from performing their function of shaping metal plates into cylindrical shapes.

4. The evidence does not establish that other types of guarding, such as electronic beams and trip or treadle devices which would permit the machines to perform their function would be more effective in preventing injury to employees at the point of operation than the controls utilized by the respondent to operate the machines.

## V. CITATION NO. 13 -- ALLEGED VIOLATION OF 29 C.F.R. §1910.213(n)(3)[8/]

### A. Summary of Evidence

The citation alleges that respondent did not provide guards for a head molder.

On April 6, 1976, Mr. Smith inspected the carpenter shop and observed a J. A. Fay and Eagan Company molder, depicted in Exhibit C-3. The molder is a mechanically-fed planer which reduces wood

---

8/ The standard provides:

> Feed rolls shall be guarded by a hood or suitable guard to prevent the hands of the operator from coming in contact with the in-running rolls at any point. The guard shall be fastened to the frame carrying the rolls so as to remain in adjustment for any thickness of stock.

fed into the machine to the desired width. Mr. Smith noted that the feed rolls which pull the wood in and feed it to the planer were not guarded so as to prevent the operator from getting his hands into the roll area. (Tr. I-179-183.)

An employee, demonstrating the operation of the machine, fed an 8-foot length of wood into the machine (in so doing the employee would get about 4 feet from the roller) let the wood go and the machine would draw the wood through. Mr. Smith was informed that the only wood put through the machine was 8 feet in length. Because the operator did not come close to the roller when feeding the machine, there was no hazard involved in feeding the wood into the machine. The hazard to employees was the possibility that in starting the machine with the start button located about 2 feet from the feed roller (designated as "A" on Exhibit C-3), or in adjusting the roller for the size of the wood with the lever or switch (marked "B" on Exhibit C-3) located about one and a half feet from the roller, the operator would be exposed to injury. Mr. Smith testified that when the operator pushed the starter button with his right hand, his left hand would be within two inches of the machine and he could be drawn into the machine. The operator could also be injured if he tripped or fell when starting or adjusting the machine.

To protect employees from injury, Mr. Smith testified that the machine needed a floating guard which would rise automatically with the thickness of the stock being cut and prevent hands from getting into the rolls. (Tr. I-182-190, 195.)

Mr. Burkhart testified for the respondent that the machine in question was 40 years old and the machine had never been involved in an accident. Mr. Burkhart was of the opinion that the possibility of an accident occurring was remote and that this was so regardless of the presence of a floating guard as recommended by Mr. Smith. (Tr. I-203.)

A penalty of $800 was proposed based on the same factors (referred to above) considered in arriving at the proposed penalties for the other violations. (Tr. I-187.)

B. Discussion

The evidence shows (and the parties agree) that the machine in question poses no hazard to the operator during the time he is feeding stock because the nearest the operator gets to the rollers is four feet. Presumably, this aspect of the operator's work takes up most of the working day.

The question for decision, therefore, is whether the operator is exposed to injury when he uses the switch two feet from the rollers to start the machine and when he uses the lever to adjust the rollers a foot and a half away. In performing these functions, the operator's hand could come within two inches of the rollers so that there is the hazard, given some unforeseen accident, distraction or carelessness, that the operator's hand could become caught in the rollers and this could result in serious injury. The hazard could be diminished, if not done away with entirely, by the installation of a floating guard.

The evidence indicates that there has been no accident involving

the machine in 40 years. The absence of a prior accident is not a defense to a citation for a violation because one purpose of the Act is to prevent the first accident. See Lee Way Motor Freight, Inc., v. Secretary of Labor, 511 F.2d 864, 870 (1975). However, a good accident record may be considered in the assessment of the penalty. Complainant proposed a penalty of $800 which is considered excessive in light of the accident-free record, the limited time the operator is exposed to the hazard, and the minimal likelihood of an accident occurring. Giving due consideration to the criteria for the assessment of penalties set forth in section 17(j) of the Act, it is determined that the appropriate penalty for this violation is $100.

## C. Findings of Fact

A preponderance of the evidence supports the following findings of fact:

1. The J. A. Fay and Eagan Company molder located in respondent's carpenter shop was not provided with guards to prevent the hands of the operator from being caught in the machine's rollers.

2. The operator of the machine was exposed to the hazard of having his hand caught in the machine's in-running rolls and, if this occurred, there would be a substantial probability that serious physical harm could result.

3. The respondent knew, or with the exercise of reasonable diligence, could have known, of the presence of the facts recited in paragraphs (1) and (2) above.

4. Giving due consideration to the size of the respondent's business, the gravity of the violations, the good faith of the respondent and the history of previous violations, the appropriate penalty for the serious violation of 29 C.F.R. §1910.213(n)(3) is $100.

## VI. CITATION NO. 1, ITEMS 15(a) AND (b) -- ALLEGED VIOLATION OF 29 C.F.R. §1910.36(d)(2)[9/]

Complainant moved to vacate the citation on the grounds that there was insufficient evidence to make out a prima facie case. The motion was granted. (Tr. I-204, 205.)

## VII. CITATION NO. 1, ITEM 7(b) -- ALLEGED VIOLATION OF 29 C.F.R. §1910.23(c)(1)[10/]

The citation alleged that a lime silo (Exhibits C-4, 5, 6 and 7) on top of which employees worked was not guarded by a standard railing

---

9/ The standard provides:

> Every automatic sprinkler system, fire detection and alarm system, exit lighting, fire door, and other item of equipment, where provided, shall be continuously in proper operating condition.

10/ The standard provides:

> Every open-sided floor or platform 4 feet or more above adjacent floor or ground level shall be guarded by a standard railing (or the equivalent as specified in paragraph (e)(3) of this section) on all open sides except where there is entrance to a ramp, stairway, or fixed ladder. The railing shall be provided with a toeboard wherever, beneath the open sides,
> (i) Persons can pass,
> (ii) There is moving machinery, or
> (iii) There is equipment with which falling materials could create a hazard.

or equivalent. The evidence indicated that all employees at all times while working on the silo, wore tied-off safety belts which would prevent their falling over the edge.

The only hazard alleged by the complainant was the possibility of an employee tripping or falling when he climbed onto the silo through or over the railing shown on Exhibits C-3 and 4, left side. A railing on the edge of the silo would not prevent such a hazard. On respondent's motion, this item was vacated (Tr. II-79).

## VIII. CITATION NO. 1, ITEM 21 -- ALLEGED VIOLATION OF 29 C.F.R. §1910.151(c)[11/]

### A. Summary of Evidence

The citation alleges that employees who were exposed to injurious corrosive material were not provided with suitable facilities for flushing of the eyes.

On April 7, 1976, the Analyzer Room in the Chemical Building was inspected by Vincent Gallagher, Compliance Officer. The room is 17 feet by 30 feet and is used to analyze waste water generated by the plant prior to its return to the Delaware River. Analyzing the water involves the use of corrosives, including sulphuric acid, which are

---

11/ The standard provides:

> Where the eyes or body of any person may be exposed to injurious corrosive materials, suitable facilities for quick drenching or flushing of the eyes and body shall be provided within the work area for immediate emergency use.

stored in bottles and poured into other items. At least one employee was working in the room when the inspection took place. (Tr. II-79, 80, 88, 111, 118.)

The facility provided by respondent for drenching or flushing of the eyes was a safety shower so that if an employee got corrosive material on his body or in his eye, he would immediately get under the shower. To drench or flush the eyes, the employee could tilt his head back and allow the water to run down his face or he could cup his hands and flush the water into his face. (Tr. II-112, 113.)

Mr. Gallagher was of the view that a suitable eyewash facility was an eyewash fountain located in the Analyzer Room. Mr. Gallagher pointed out drawbacks to the use of the safety shower for washing the eyes. These included the reluctance an employee might have to getting totally drenched just to wash his eyes and going instead to the nearby washroom, and the difficulty breathing with the head tilted back while in the shower for the length of time needed to thoroughly wash the eyes. (Tr. II-84, 85.)

B. Discussion

The standard refers to the eyes and body separately, an indication that insofar as injurious corrosives are concerned, the eyes need special consideration due to their vulnerability to injury, and the dire consequences which could result from contact with corrosive material. Consequently, it is not considered that a shower is a "suitable" facility for drenching or flushing the eyes. The standard refers to "quick drenching or flushing" for "immediate emergency use."

This is not accomplished by a shower designed primarily for drenching or flushing the body. In the cases referred to by respondent[12/] at the hearing, the facilities available permitted application of water directly to the eyes, whereas with a shower the water is diffused.

C. Findings of Fact

A preponderance of the evidence supports the following findings of fact:

1. Employees in the Analyzer Room, Chemical Building, were exposed to injurious corrosive materials.

2. Suitable facilities for quick drenching or flushing of the eyes were not provided by the respondent.

3. Respondent knew, or with the exercise of reasonable diligence could have known, of the facts recited in paragraphs (1) and (2) above.

4. Giving due consideration to the size of respondent's business, the gravity of the violation, the respondent's good faith and history of previous violations, it is determined that the penalty of $135 proposed by complainant for the violation referred to above is appropriate.

ORDER

Upon the basis of the foregoing and upon the entire record, it is ORDERED that:

---

12/ Secretary v. Idaho Travertine Corp., Docket No. 1134 (1977) 77 OSAHRC (57/A2, 5 OSHC 1504 (two hoses and nozzles)); Secretary v. Lee-Way Motors, Inc., Docket No. 1105 (1974), 74 OSAHRC 22/D12, 1 OSHC 1689 (screw type water faucet); Secretary v. Courier Newsom Express, Inc., Docket No. 2231 (1973), 73 OSAHRC 49/F2, 1 OSHRC 3213 (washroom facilities); Secretary v. Colmak Industries, Inc., Docket No. 1874 (1974), 74 OSAHRC 37/D11, 2 OSHC 3049 (fresh water available in nearby tanks).

1. Citation No. 1, item 20(h) for violation of 29 C.F.R. §1910.132(a) is vacated.

2. Citation No. 1, item 2(a) for violation of 29 C.F.R. §1910.22(a)(2) is vacated.

3. Citation No. 1, item 18 for violation of 29 C.F.R. §1910.94(c)(2) is affirmed and a penalty of $80 is assessed.

4. Citation No. 12, items 1(b) and (c) for violation of 29 C.F.R. §1910.212(a)(3)(ii) are vacated.

5. Citation No. 13 for violation of 29 C.F.R. §1910.213(n)(3) is affirmed and a penalty of $100 is assessed.

6. Citation No. 1, items 15(a) and (b) for violation of 29 C.F.R. §1910.36(d)(2) are vacated.

7. Citation No. 1, item 7(b) for violation of 29 C.F.R. §1910.23(c)(1) is vacated.

8. Citation No. 1, item 21 for violation of 29 C.F.R. §1910.151(c) is affirmed and a penalty of $135 is assessed.

DECISION

Before ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

A decision of Administrative Law Judge Cecil L. Cutler is before the Commission pursuant to section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). In his decision, Judge Cutler affirmed a citation that alleged a serious violation of the Act for the failure of Respondent, Edward Kelly & Sons, Inc., to comply with the standard found at 29 C.F.R. § 1926.652(b).[1/] Respondent had sloped the top seven feet of soft, unstable soil in a twelve-foot deep trench, but had not sloped the bottom

---

1/ 29 C.F.R. § 1926.652(b) provides:

> § 1926.652 Specific trenching requirements.
>
> * * *
>
> (b) Sides of trenches in unstable or soft material, 5 feet or more in depth, shall be shored, sheeted, braced, sloped, or otherwise supported by means of sufficient strength to protect the employees working within them. See Tables P-1, P-2 (following paragraph (g) of this section).

five feet of hard and compact soil. For the reasons that follow, we conclude Respondent complied with the applicable sloping requirements. Accordingly, we reverse Judge Cutler's decision and vacate the section 1926.652(b) citation.

I

Respondent is a Toledo sewer contractor employing twenty to twenty-five employees. On May 13, 1976, Respondent was laying thirty-inch concrete sewer pipe into a trench in Holland, Ohio. The trench was twelve feet deep, four to five feet wide at the bottom, and twenty to twenty-two feet wide at the top. During the course of the morning, the depth of the trench increased from seven or eight feet to twelve feet as the work progressed up the rise of a slight hill. The bottom five feet of the trench consisted of hard, blue clay; the soil above the five-foot level consisted of "average" soil, composed of brown, sandy clay. Only the top portion of the trench above the five-foot section of hard, blue clay was sloped. The bottom five feet of the walls were vertical. The soil was wet around utility pipes which were about five feet from the surface and which had broken. As the work proceeded up the hill, Doug McKee, an Occupational Safety and Health Administration ("OSHA") compliance officer, inspected the site. He observed three men working in the trench near the bottom.[2/]

---

2/ The compliance officer was the Secretary's only witness. At the close of his testimony, Respondent moved for an involuntary dismissal pursuant to Rule 41(b) of the Federal Rules of Civil Procedure. Respondent argued that the Secretary had failed to show that the sides of the trench were not sloped sufficiently to protect employees working within and that there was no showing employees were subjected to a hazard. Administrative Law Judge Garl Watkins, who was initially assigned

(continued on next page)

Henry Combs, Respondent's foreman at the construction site, testified that as the work on the trench proceeded up the hill, the bottom of the trench, about the lower five feet, was composed of blue, hard clay and the remainder of the trench, approximately seven feet, was composed of average soil consisting of a brown, sandy clay. On the hill, three gas line conduits and drain tiles laid to get rid of water in the field had been broken. Mr. Combs stated that some water had run out of the broken drain tiles into the bottom of the trench. The water was drained through the sewer pipe already laid. The foreman stated that the average soil

---

2/ (continued)

to hear the case, granted the motion and asked for briefs from both parties. Prior to issuing an official order, Judge Watkins died. The case was reassigned to Judge Cutler, who concluded that Judge Watkins had incorrectly granted Respondent's motion and issued an order on March 8, 1978, denying Respondent's motion. Respondent argues on review that Judge Watkins' oral statement granting Respondent's motion was a judicial action leaving entry of a written order only a ministerial formality and, therefore, that Judge Cutler erred in denying Respondent's motion.

We reject Respondent's argument. Under § 12(j), 29 U.S.C. § 661(i), of the Act and Commission Rule 90, 29 C.F.R. § 2200.90, a judge retains jurisdiction of a case until his report of the case is docketed by the Commission's Executive Secretary. Once a judge's report is docketed, he no longer has jurisdiction. Singleton Sheet Metal Works, 73 OSAHRC 6/F6, 1 BNA OSHC 1062, 1971-73 CCH OSHD ¶ 15,273 (No. 878, 1972). However, until the judge's report is docketed, it is not submitted for consideration to Commission members and may be modified by the judge. Rob't W. Setterlin, 76 OSAHRC 53/D8, 4 BNA OSHC 1214, 1975-76 CCH OSHD ¶ 20,682 (No. 7377, 1976); Gurney Industries, 74 OSAHRC 8/A2, 1 BNA OSHC 1376, 1973-74 CCH OSHD ¶ 16,805 (No. 722, 1973). Accord, H.S. Holtze Construction Co. v. Marshall, 627 F.2d 149 (8th Cir. 1980).

In this case, Judge Watkins did not file a written decision with the Executive Secretary. Therefore, the judge retained jurisdiction of the case and could have reversed or modified his ruling. The parties agreed that the record made before Judge Watkins would stand and be considered part of the record before Judge Cutler. Judge Cutler therefore had the same authority to consider the record as had Judge Watkins. Accordingly, Judge Cutler had jurisdiction of the case and had the power to deny Respondent's motion to dismiss.

above the five-foot level was sloped but that the bottom five feet was not sloped because the soil was hard, blue clay. Mr. Combs stated that he thought the trench was safe.

Respondent also presented as witnesses two experienced safety inspectors, Lloyd Oliver and William Moening, from the Ohio Industrial Commission's Division of Safety and Hygiene. They had arrived at Respondent's worksite to make a routine inspection at the same time that the OSHA compliance officer was making his inspection. Mr. Oliver stated that there was some clay towards the bottom of the trench and then some sand and a loam top soil. Mr. Moening stated that the bottom four or five feet was solid blue clay and the next five or six feet was sand. On top, there was some top soil and clay-type soil. They both testified that the sides of the trench were being sloped at an angle of repose for the type of soil excavated and they concluded that the sides of the trench were sufficiently sloped to protect employees working within them from the danger of moving ground. They stated they found no evidence that any soil was likely to slip, slide, or move. Respondent introduced into evidence the Ohio inspectors' reports to that effect.

On May 17, 1976, four days after the compliance officer's inspection, Merle Allen of the Ohio Industrial Commission's On-Site Consultation Service arrived at the site, pursuant to Respondent's request. Mr. Allen previously had been an OSHA compliance officer for the Toledo district office. The On-Site Consultation Service is an Ohio state agency that advises employers concerning the applicability of OSHA regulations. Mr. Allen testified that the bottom five feet consisted of hard, compact soil and he concluded that the sides of the trench were sloped in compliance with applicable OSHA regulations.

II

Respondent argued to Judge Cutler that the Secretary had failed to establish that the soil in the trench was "soft and unstable" within the meaning of section 1926.652(b). Respondent further argued that, even if the soil in the trench was considered soft and unstable, Respondent had complied with section 1926.652(b) by sloping all the sandy, brown clay soil above the bottom five feet of hard, blue clay in accordance with the one-to-one sloping requirements for average soil found in Table P-1 to which section 1926.652(b) refers. Respondent argued that section 1926.652(b) should be read in conjunction with section 1926.652(c),[3/] which requires sloping of hard, compact soil only above the bottom five feet. Accordingly, Respondent contended that the bottom five feet of hard soil in a trench need not be sloped even if the soil above it is soft and unstable.

Judge Cutler rejected Respondent's arguments. The judge found that the trench "ranged in depth from seven or eight to twelve feet" and was four to five feet wide at the bottom. He also found, relying on Respondent's evidence, that the trench was sloped above the five-foot level to a

---

3/ 29 C.F.R. § 1926.652(c) provides:

§ 1926.652 Specific trenching requirements.

* * *

(c) Sides of trenches in hard or compact soil including embankments, shall be shored or otherwise supported when the trench is more than 5 feet in depth and 8 feet or more in length. In lieu of shoring, the sides of the trench above the 5-foot level may be sloped to preclude collapse, but shall not be steeper than a 1-foot rise to each 1/2-foot horizontal. When the outside diameter of a pipe is greater than 6 feet, a bench of 4-foot minimum shall be provided at the toe of the sloped portion.

width of twenty to twenty-two feet at the top. The judge found that the bottom five feet of soil in the trench was blue, hard clay and, above that to the surface, the soil was brown clay with sand in it, described as "average" soil. Judge Cutler concluded this average soil above the five-foot level was soft and unstable soil within the meaning of section 1926.652(b). The judge noted that if sloping were required for only the average soil resting on the hard clay, then Respondent's sloping of the soil above the five-foot level was sufficient to comply with Table P-1 and section 1926.652(b). Relying on Connecticut Natural Gas Corp., 78 OSAHRC 60/B3, 6 BNA OSHC 1796, 1978 CCH OSHD ¶ 22,874 (No. 13964, 1978), Judge Cutler concluded that Respondent violated section 1926.652(b) by failing to slope the trench from the bottom because the amount of unstable soil was not negligible. However, because the trench, as sloped, presented a minimal hazard of cave-in or collapse and since Respondent had acted in considerable good faith in attempting to comply with the Secretary's regulations, Judge Cutler assessed a penalty of $1.00.

III

Respondent petitioned for review of the judge's decision. Former Commissioner Barnako directed review of the issues raised in Respondent's petition.

On review, Respondent argues that there was no hazard presented to employees from its failure to slope the bottom five feet of the trench. Respondent relies on the Commission's decision in W.N. Couch Construction Co., 76 OSAHRC 44/A2, 4 BNA OSHC 1054, 1975-76 CCH OSHD ¶ 20,574 (No. 7370, 1976) ("Couch"), and points to the Commission's statement in that case that section 1926.652(b) only requires an employer to slope

or shore the "soft or unstable constituents of trench walls" in trenches at least five feet deep. 4 BNA OSHC at 1056, 1975-76 CCH OSHD at p. 24,592. Respondent concludes it complied with the requirements of section 1926.652(b) by sloping all unstable soil in its trench. Respondent further contends that Judge Cutler misinterpreted Connecticut Natural Gas Corp. since Couch, supra, to which Connecticut Natural Gas Corp. refers, only held that section 1926.652(b) requires the sloping of the "soft or unstable constituents of trench walls."[4/]

The Secretary argues that a preponderance of the evidence supports the judge's conclusion that the trench was not properly sloped. The Secretary states that to comply with the one-to-one sloping requirements which Table P-1 establishes for average soil, the trench, which was twelve feet deep and four and one-third feet wide at the bottom, should have been twenty-eight and one-third feet wide at the top. The Secretary continues that since no testimony estimated that the trench's width at the top was twenty-eight and one-third feet, and since the judge accepted Respondent's testimony that the trench was twenty-two feet wide at the top, the trench was not sufficiently sloped.[5/] The Secretary concludes that Judge Cutler properly applied the Commission's decision in Connecticut

---

4/ The Associated General Contractors of America has filed an amicus brief in support of Respondent, contending that no violation can be affirmed absent a finding that the trench was dug in soft or unstable soil; that Couch only requires sloping of soft, unstable soil; and that there is no evidentiary basis in this case to conclude employees were not sufficiently protected by sloping soil only above the five-foot level.

5/ In his brief on review, the Secretary states that although the only factual dispute at the hearing, the width of the trench at the surface, was decided adversely to him, he does not take exception to the judge's resolution of the factual dispute since a violation was established even accepting Respondent's testimony of the trench's width at the surface. Accordingly, the dimensions of the trench are not in dispute.

Natural Gas Corp., supra, to affirm the citation and that his decision should be affirmed.

IV

In this case, the trench walls were composed of a distinct layer of hard soil underneath a distinct layer of soft soil.[6/] Respondent sloped the soft layer but not the hard layer. In Couch, supra, on which Respondent relies, the trench was composed of four and one-half feet of soft and unstable soil above about six and one-half feet of hard or compact soil. The Commission stated that the trench was regulated by section 1926.652(b) and, because Couch failed to slope any soil in its trench, the Commission concluded that Couch violated section 1926.652(b). The Commission also stated that section 1926.652(b) requires an employer to slope or shore "all soft or unstable constituents" of trench walls so long as the trench is five feet or more in depth and the soft or unstable portion is not so small as to be "insignificant." Id. at note 5 and accompanying text, 4 BNA OSHC at 1056, 1975-76 CCH OSHD at p. 24,592.

If a trench is excavated in hard, compact soil, the trench is regulated by section 1926.652(c) and may have vertical walls up to five feet from the bottom. National Industrial Constructors, Inc., 81 OSAHRC

---

6/ Respondent argues that the judge did not make a finding that the soil in the trench was unstable. However, the judge specifically found that the sandy, brown clay in the top of the trench was soft or unstable soil within the meaning of § 1926.652(b). We adopt the judge's finding. See Kent Nowlin Construction Co., 80 OSAHRC 39/A10, 8 BNA OSHC 1286, 1980 CCH OSHD ¶ 24,459 (No. 76-192, 1980) (the trenching standards including Table P-1 create a rebuttable presumption that primarily sandy soils, unless cemented, are unstable within the meaning of § 1926.652(b)).

Chairman Rowland agrees to adopt the judge's finding that the soil in the top of the trench was soft or unstable. However, Chairman Rowland does not rely on the "rebuttable presumption." Rather, he adopts the judge's finding because the record as a whole shows that the soil in the top of the trench was soft or unstable.

10 BNA OSHC 1081, 1091 n. 25, 1981 CCH OSHD ¶ 25,473 at p. 32,132 n. 25 (No. 76-4507, 1981). If a trench is excavated in soft and unstable soil, it is regulated by section 1926.652(b) and it must be sloped from the bottom. Connecticut Natural Gas Corp., supra. However, where a trench wall is clearly divided into a soft soil section above a hard soil section, we conclude that section 1926.652(b) must be read with section 1926.652(c). Since the bottom five feet of soil in this case was hard and compact, only the soil above the five-foot level was required to be sloped.[7/] The Secretary has pointed to no evidence showing that the strength of the entire trench wall was affected by the layer of soft or unstable soil above the layer of hard, compact soil.[8/] Our construction of section 1926.652(b) in

---

7/ Since Couch, the Commission has required that trench walls be sloped from the bottom despite claims that the trench walls were composed of nonhomogenous soil and claims that portions of the wall did not require sloping because of the stability of the soil material. However, in no case since Couch have we been confronted with a trench wall clearly divided into a soft section above a hard soil section. In Connecticut Natural Gas Corp., supra, the Commission accepted a judge's finding that all soil below a concrete overhang in a trench was unstable and stated that "as long as the trench is more than five feet in depth and the amount of unstable soil is not negligible, all soil in the trench must be shored or sloped." 6 BNA OSHC at 1799, 1978 CCH OSHD at p. 27,669. There, the phrase "all soil must be shored or sloped" referred to the soft, unstable soil which composed that trench. In Communications, Inc., 79 OSAHRC 61/A2, 7 BNA OSHC 1598, 1979 CCH OSHD ¶ 23,759 (No. 76-1924, 1979), aff'd, No. 79-2148 (D.C. Cir., Dec. 29, 1981), the Commission accepted the judge's findings, based on credibility, that the soil was unstable and, therefore, section 1926.652(b) required that the trench wall be sloped from the bottom. In CCI, Inc., 80 OSAHRC 127/D4, 9 BNA OSHC 1169, 1981 CCH OSHD ¶ 25,091 (No. 76-1228, 1980), appeal filed, No. 81-1218 (10th Cir., Feb. 25, 1981), the Commission applied the principle that a trench wall composed of nonhomogenous soil was only as stable as its weakest component and therefore required the wall composed of rock and less stable materials to be sloped. However, the trench wall was not composed of two distinct and uniform soil sections.

8/ The testimony concerning water in the trench was that it was present around utility pipes, which cut across the trench. Although some water had run out of the broken utility pipes, the water drained through the

(continued on next page)

this case recognizes what is implicit within section 1926.652(c): hard or compact soil in the bottom five feet of a trench does not pose a cave-in hazard to employees working within that trench.

All of the Respondent's witnesses agreed that the trench, as sloped, was safe. Judge Cutler also found that Respondent had properly sloped the top seven feet of soft or unstable soil, in accordance with section 1926.652(b). Accordingly, we conclude that the trench walls were properly sloped within the meaning of section 1926.652(b). The judge's decision affirming the citation is therefore reversed and the citation is vacated. SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

RAY H. DARLING, JR.
EXECUTIVE SECRETARY

8/ (continued)

sewer pipe already laid. Thus, the water was present only to a limited extent. Therefore, there was only a very small section of soil (around the pipes) which could possibly be affected by the presence of water. We do not believe this evidence to be sufficient to find that the soil in the trench was destabilized due to the presence of water. Cf. Joseph J. Stolar Construction Co., 81 OSAHRC 66/C6, 9 BNA OSHC 2020, 1981 CCH OSHD ¶ 25,488 (No. 78-2528, 1981), aff'd, No. 81-4146 (2nd Cir., Dec. 11, 1981) (section 1926.652(b) required twelve-foot trench wall to be sloped from bottom where water in the lower part of wall destabilized the hard, compact soil above the wet, unstable part).

## DECISION AND ORDER

APPEARANCES: William S. Kloepfer, Esquire, Associate Regional Solicitor, U. S. Department of Labor, Cleveland, Ohio, by Benjamin T. Chinni, Esquire, for complainant.

Richard S. Baker, Esquire, Toledo, Ohio, for respondent.

## STATEMENT OF THE CASE

Cutler, Judge

On May 25, 1976, respondent, Edward Kelly & Sons, Inc., (hereinafter "Kelly"), was issued two citations by the Secretary pursuant to section 9(a) of the Occupational Safety and Health Act of 1970 (29 U.S.C. 551 et seq., hereinafter the "Act"). Following a timely Notice of Contest, hearings were held on January 19 and March 10, 1977, before Judge Garl Watkins. At the hearing on January 19, the Secretary moved to dismiss one citation and it was accordingly vacated by Judge Watkins.

Under Citation 1, which remains for decision, Kelly was cited for failure to comply with the provisions of 29 C.F.R. § 1926.652(a)[1/] as follows:

> "The sides of a trench in unstable, soft, sandy soil were not sloped or supported by means of sufficient strength to protect employees working in it.
> Location: Spring Meadows project."

At the first hearing, the Secretary moved to amend the citation to allege a violation of 29 C.F.R. § 1926.652(b).[2/] Over respondent's objection, Judge Watkins granted the motion.

At the continuation of the hearing on March 10, 1977, the Government presented the testimony of one witness and then rested. Kelly moved to dismiss the citation for lack of proof. This motion was granted by Judge Watkins but he reserved final decision for the parties were afforded the opportunity to submit briefs on the issue.

---

1/ This section provides:

> "Banks more than 5 feet high shall be shored, laid back to a stable slope, or some other equivalent means of protection shall be provided where employees may be exposed to moving ground or cave-ins. Refer to Table P-1 as a guide in sloping banks. Trenches less than 5 feet in depth shall also be effectively protected when examination of the ground indicates hazardous ground movement may be expected."

2/ This section states:

> "Sides of trenches in unstable or soft material, 5 feet or more in depth, shall be shored, sheeted, braced, sloped, or otherwise supported by means of sufficient strength to protect the employees working within them. See Tables P-1, P-2 (following paragraph (g) of this section)."

Before a formal ruling on the motion was issued, Judge Watkins passed away and the case was assigned to me. Both parties agreed that a decision on the motion could be made on the existing record, although Kelly argued that Judge Watkins' ruling should be considered as final.

Upon my examination of the record, I concluded that the Secretary had established a prima facie case and respondent's Motion to Dismiss should be denied. Accordingly, an order, dated March 6, 1978, was so entered.

To provide respondent the opportunity to present its case in chief, I directed that the hearing be reconvened. Both parties agreed that the the Secretary's case in chief need not be presented again and that the existing testimony be made a part of the record. The hearing was reconvened by me on May 11, 1978, in Toledo, Ohio. No affected employee or employee representative elected to participate.

I

The Government's case rests primarily upon the testimony of Mr. Doug McKee, a compliance officer for the Secretary, together with the photographs and sketches he made. Mr. McKee is an environmental hygienist who testified he was untrained in safety hazards except for a four-week OSHA course in 1973. However, he was not offered as an expert in soil composition or trenching hazards (Tr. I-42-43).[3/]

According to Mr. McKee, on the date of the inspection he was driving past respondent's work site in Holland, Ohio, when he observed a man working in a trench by the roadside. Since it appeared to be a possible

---

3/ To avoid confusion, reference to pages in the March 1977 transcript will be preceded by the Roman numeral I and by II for the May 1978 hearing transcript.

dangerous situation, he stopped to investigate. At the site he identified himself and talked with Kelly's on-site foreman (Tr. I-12,13). He observed three men, whom he ascertained to be Kelly's employees, laying sewer tile in the trench. One man was at the bottom shoveling and the other two were standing on the pipe which was five feet from the top (Tr. I-15, 18). The foreman telephoned Mr. Kelly, the vice-president of the company, and Mr. McKee was then asked to hold up his inspection until Mr. Kelly arrived. After Mr. Kelly arrived and the two conversed, Mr. McKee stated he wanted to talk with his boss on the phone "because of my inexperience with these matters; that I hadn't done that much trenching." After the call, he returned to the site and saw the sides of the trenches were being pulled back with a digging machine. He then quickly began to take measurements (Tr. I-14, 18).

Continuing his testimony, Mr. McKee stated that he paced the width of the trench at the top and ascertained it to be 10 to 12 feet wide. From visual obseration of the width of the shovel and pipe, he estimated the bottom width to be four to five feet. The foreman measured the depth with a measuring stick and mentioned it to be 12 feet (Tr. I-15, 16).

According to Mr. McKee, the trench was not shored, braced, or supported in any way. The horizontal slope was "60 to 70, 75 degrees, somewhere in that vicinity" (Tr. I-17). "Water seemed to be all around the utility pipes" and "a couple of inches" were in the bottom of the trench (Tr. I-18). He also observed that "quite a bit of soil crumbled off and went into the bottom of the trench." It "seemed to be oozing at times and at other

times it would kind of crumble, but it seemed to be very wet" (Tr. I-19). Near the top it was fairly damp and there was some slight undercutting (Tr. I-20). The soil at the bottom of the trench he believed was clay material which extended four feet high and above that there was "yellow soil of some kind" (Tr. I-41). He did not pick up or touch the soil (Tr. I-41), and it does not appear from the evidence that he entered the trench.

In his testimony concerning the use of the pictures placed in evidence, Mr. McKee stated that they played no role in his computation of angles, the composition of the soil, or in the decision-making process (Tr. I-30, 31).

At the hearing on May 11, 1978, respondent presented the following evidence. Edward J. Kelly & Sons, Inc. is a small Toledo sewer contractor with some 20 years in business employing 20 to 25 employees. According to Mr. Henry Combs, general foreman, on the morning of May 13, 1976, the firm was engaged in laying a 30-inch concrete pipe sewer north from a catch basin at Airport Highway near McCord Road in Lucas County, Ohio. A hydraulic back hoe with a 52-inch-wide bucket was being used to excavate the trench (Tr. II-31, 32). During the course of the morning, the depth of the trench increased from seven or eight feet to 12 feet as the work progressed up to the rise of a slight hill. The excavation was made in a stair-step configuration and the trench was finished by taking the bottom dirt with a full bucket and pushing on both sides of the trench to get the soil out from the bottom. The result was to take the edges off "the stairs" and to remove all loose material from the trench (Tr. II-12). After the work progressed towards the top of the hill, there was five feet of blue, hard clay from the

bottom of the trench and, above that to the surface, seven feet of "average soil which would be a brown clay with sand in it" (Tr. II-13, 14, 112, 128). The average soil or sandy clay was being laid back on the slope to a width of 20 to 22 feet at the top of the trench (Tr. II-14). The sloping was stable with no indication of crumbling or falling earth (Tr. II-24). Water in the bottom of the trench drained naturally by gravity down through the pipe and presented no danger (Tr. II-26).

At 10:30 or 11:00 a.m., Mr. McKee arrived and introduced himself to Mr. Combs. Mr. McKee then proceeded to ask Mr. Combs if he thought the trench was safe; Mr. Combs said, "Yes it was." Mr. McKee said it was not (Tr. II-15). Mr. Combs then asked Mr. McKee to wait for Mr. Al Kelly, who was on his way to the jobsite. When Mr. Kelly arrive, the three men engaged in a discussion during which Mr. McKee was asked what would be a safe trench. Mr. McKee replied he didn't know (Tr. II-16, 113). Mr. McKee then went to make a telephone call and returned some ten minutes later with an answer that "It should be a forty-five degree angle" (Tr. II-15, 113). Mr. Kelly then asked Mr. McKee how wide a 45-degree angle would be and Mr. McKee stated that he didn't know (Tr. II-16, 113). Mr. McKee was asked to point out on the ground or explain how wide the trench should be and he stated that he could not do that (Tr. II-17, 18, 113).

Mr. McKee explained that there was no one at his office who could help him and that this was about the first time he had really looked at a construction job (Tr. II-114).

No measurements of any kind were taken by Mr. McKee and none were discussed during his conversations with Mr. Combs and Mr. Kelly (Tr. II-17,

114). At this point, work was again commenced and the upper width of the trench was increased to 26 feet. Mr. McKee was asked whether "that was far enough and he would not give us an answer" (Tr. II-20, 115). Mr. Kelly asked Mr. McKee whether he was going to test the soil and Mr. McKee stated that he would but no samples were ever taken (Tr. II-116).

At the same time that Mr. McKee was looking around the site, two construction safety consultants from the Division of Safety and Hygiene of the Industrial Commission of Ohio arrived at the site. One was Lloyd Oliver, a construction safety inspector for the state of Ohio for some eight years, and the other was William Moening, Supervisor of Construction Safety for Northwestern Ohio, and formerly himself an inspector for ten years. Each man had conducted 1,500 to 2,000 sewer construction project inspections during the course of their respective employments.

Mr. Oliver and Mr. Moening was present to make a routine inspection and not because of any complaint or objection of any kind (Tr. II-21). They examined the work and determined that the slopes of the trench were at an angle of repose for the material being excavated (Tr. II-53, 54, 55, 58, 75, 84). They found no evidence that there was anything liable to slip, slide or move (Tr. II-76, 77). Mr. Oliver "was very well satisfied after looking the situation over, that he was doing as good a job that it was possible to do and I didn't see any reason to feel that anyone would be unsafe in that trench" (Tr. II-55). Mr. Moening was of the opinion that the sides of the trench were sloped sufficiently to protect the employees working within them from moving ground, cave-ins or collapse (Tr. II-78). Having satisfied themselves that the work was progressing properly, Mr. Oliver and Mr. Moening then left the jobsite.

Sloping of the sides of the trench had proceeded according to OSHA regulations as they had been explained to Mr. Edward Kelly during an earlier conference with Mr. Olsen, the assistant area director for the OSHA Toledo district office (Tr. II-129). Mr. Olsen had advised that sloping was required in hard, compact soil only about five feet, and an earlier citation had been dismissed on that basis (Tr. II-130). Because this project was bottomed in five feet of hard, compact, blue clay, sloping was commenced at the five-foot level where average soil (sandy, brown clay) was reached, resulting in a slope from 35 degrees to 43 degrees.

After Messrs. McKee, Oliver and Moening had departed, Mr. Al Kelly telephoned the director of the On-site Consultation Service of the Ohio Industrial Commission and requested an immediate consultation (Tr. II-116). That agency is a state agency funded partially by the federal government to give advice upon the application of OSHA regulations (Tr. II-89; respondent's Exhibit D). In response to that request, Mr. Merle Allen conducted an inspection of the jobsite on the following Monday, May 17, 1976. At the time of Mr. Allen's inspection, the work had progressed 200 to 220 feet from the utility pole (Tr. II-30, 118), but the excavation continued in basically the same soil, blue clay on the bottom and average soil (sandy, brown clay) on top (Tr. II-30, 119). At the point of Mr. Allen's inspection, the trench was ten feet in depth with five feet of clay at the bottom. The trench was four feet wide at the bottom and 18 feet wide at the top. Mr. Allen concluded that the bottom five feet were constituted of hard, compact soil (Tr. II-106) and therefore calculated an angle of repose commencing at the five-foot level, resulting in an angle of 35.5 degrees which in his opinion was in

compliance with applicable OSHA regulations (Tr. II-102; respondent's Exhibit D). Before joining the Ohio On-site Consultation Service, Mr. Allen had himself been an OSHA safety compliance officer for the Toledo district OSHA office.

Mr. Allen's application of OSHA regulations to the trench in question was the same application which had previously been explained to Mr. Edward Kelly by Mr. Olsen, the assistant district director in Toledo, in connection with a previous citation (Tr. II-130).

II

Reduced to its simplest terms, the issue in this case is the manner in which a trench cited under section 1926.652(b) must be sloped. Respondent argues that this section must be read in conjunction with section 1926.652(c)[4/] relating to sides of trenches in hard or compact soil. Thus, the sloping of the trench in question could be started after the hard-clay level could be reached.

Giving the respondent a reasonable benefit of doubt, I evaluate the evidence to show the trench was 12 feet deep, five feet wide at the bottom, and laid back above the five-foot level to a width of 20 to 22 feet. The first five-foot layer of soil was composed of blue, hard clay and above that to the top, it was brown clay with sand in it and described as "average" soil.

---

4/ This section states:

> "Sides of trenches in hard or compact soil, including embankments, shall be shored or otherwise supported when the trench is more than 5 feet in depth and 8 feet or more in length. In lieu of shoring, the sides of the trench above the 5-foot level may be sloped to preclude collapse, but shall not be steeper than a 1-foot rise to each 1/2-foot horizontal. When the outside diameter of a pipe is greater than 6 feet, a bench of 4-foot minimum shall be provided at the toe of the sloped portion."

It is clear that, if respondent's theory of the case is applied, the trench was properly sloped. If sloping need only be made for the seven feet of average soil resting on the hard clay, then the trench need only be 19 feet wide (7 + 7 + 5). This is reached by applying the 1-to-1 formula set forth for average soil in Table P-1 under section 1926.652 and referred to in subsection (b). Respondent's evidence is that the soil was laid back to a greater width.

On the other hand, complainant argues that subsection 1926.652(b) and (c) cannot be combined and Commission cases support the Secretary's position. In a very recent case involving an alleged violation of 1926.652(b), Connecticut Natural Gas Corporation (____ OSAHRC ____, ___ CCH OSHD ___, Docket No. 13964, decided June 30, 1978), the Commission, citing W. H. Couch Construction Co.,[5/] stated:

> "[A]s long as the trench is more than five feet in depth and the amount of unstable soil is not negligible, all soil in the trench must be shored or sloped" (emphasis added).

Connecticut Natural Gas, supra, appears to be the final word by the Commission and thus would foreclose combining the standards.

Respondent argues that there is no evidence to establish that the top seven-foot layer of soil was "soft or unstable" as set forth in section 1926.652(b). It is contended that, if there is no proof that the soil was unstable, as defined by section 1926.653(q),[6/] it must be "hard compact soil"

---

5/ 76 OSAHRC 44/A2, 1975-76 CCH OSHD ¶ 20,574 (1971).

6/ Section 1926.653(q) states:

> "(q) 'Unstable soil'—Earth material, other than running, that because of its nature or the influence of related conditions, cannot be depended upon to remain in place without extra support, such as would be furnished by a system of shoring."

as defined in section 1926.653(h).[7/] Thus, section 1926.652(c) would be the appropriate standard to apply in this case.

I agree that evidence as to the composition of the soil cannot be based upon the testimony of Mr. McKee, the government's witness. He neither examined nor tested the soil and patently was no expert. However, respondent's witnesses have described the soil as brown clay with sand in it or average soil. I will accept this but it does not help respondent.

In Connecticut Natural Gas, supra, the Commission stated:

> "In addition to the definitions of 'unstable soil' and 'hard compact soil' in §1926.653, §1926.652 contains Table P-1, which illustrates the approximate angle of repose for different types of earth material. This Table lists an angle of repose of 1/2 to 1 for compacted angular gravels, and less steep slopes for average soils, compacted sharp sand, and well rounded loose sand. Since §1926.652(c) requires a slope of not steeper than 1/2 to 1 for hard or compact soil, it is evident that those materials listed in Table P-1 as having a less steep angle of repose must be considered soft or unstable, and are therefore regulated by §1926.652(b)."

Considering the evidence even in the light most favorable to respondent, it is clear that, based upon the holding of Connecticut Natural Gas, supra, a significant amount of soil in the trench was "soft or unstable" and therefore properly charged under § 1926.652(b). Further, as this recent case dictates, respondent's sloping should have started at the bottom and not at the five-foot mark.

In reaching my decision, I am fully aware of and respect the opinions of the experts as to the safety of the trench. I conclude that, while a cave-in or collapse could cause death or serious injury to an employee working

---

7/ Section 1926.653(h) states:

> "(h) 'Hard compact soil'—All earth materials not classified as running or unstable."

therein, the probability of such was very remote. I further find that respondent has acted in good faith having based its interpretation of the standards upon opinions of several experts, including a former OSHA compliance officer and an assistant district director. However, the Couch, supra, and Shaw[8/] decisions, as explicated in Connecticut Natural Gas, supra, make it abundantly clear that their interpretation was erroneous.

The Secretary has proposed a penalty of $850 for this alleged serious violation. However, considering the factors previously alluded to of good faith and the improbability of cave-in or collapse and the fact that the trench was appreciably sloped, a penalty of $1.00 is appropriate and equitable.

I reach the following findings of fact and conclusions of law:

## FINDINGS OF FACT

1. Respondent is a small Toledo, Ohio, sewer contractor employing 20 to 25 employees.

2. On May 13, 1976, respondent was engaged in laying a 30-inch concrete pipe sewer at Airport Highway near McCord Road in Lucas County, Ohio.

3. The trench being dug by respondent's employees ranged in depth from seven or eight feet to 12 feet. It was four to five feet wide at the bottom and laid back above a height of five feet to about 20 to 22 feet at the top. The composition of the soil of the bottom five feet was blue, hard clay and, above that to the surface, it was average soil (sandy, brown clay).

---

8/ 78 OSAHRC 9/B6; 1978 CCH OSHD ¶ 22,524 (1978).

4. The trench, as sloped in this case, presented minimal hazard of cave-in or collapse such as would expose respondent's employees to death or serious physical harm.

5. Respondent has acted in considerable good faith in attempting to comply with the regulations.

## CONCLUSIONS OF LAW

1. Respondent is engaged in a business affecting interstate commerce and the Commission has jurisdiction over the subject matter and parties to this action.

2. Respondent was in violation of article 5(a)(2) of the Act by failing to comply with the provisions of 29 C.F.R. § 1926.652(b).

Based upon the foregoing findings of fact and conclusions of law, Citation Number 1 for a serious violation is affirmed and a penalty of $1.00 is assessed therefor.

SO ORDERED.

Dated this 9th day of August, 1978.

CECIL L. CUTLER, JR.
Judge

| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>AMERICAN CAN COMPANY,<br><br>Respondent.<br><br>UNITED STEELWORKERS of AMERICA and its LOCAL 1478,<br><br>Authorized Employee Representatives. | OSHRC Docket Nos. 76-5162, 77-773, and 78-4478 |

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

The primary question for decision is whether the occupational noise standard at 29 C.F.R. § 1910.95(b)(1) is invalid. American Can Company claims that the standard is invalid because: (1) scope and application provisions that accompanied the established federal standard from which it was derived were not adopted with it; and (2) the established federal standard was itself invalid. We hold that the first argument lacks merit and that the second argument may not now be considered.

I.

The Secretary of Labor ("the Secretary") issued to American Can Company ("American Can") citations alleging that, contrary to paragraph (b)(1) of the occupational noise standard at 29 C.F.R. § 1910.95 ("the OSHA noise standard"), American Can's employees were exposed to sound levels above those in Table G-16,

and that feasible administrative or engineering controls were not used. 1/ American Can contested the citations and the Secretary filed complaints; one of the complaints added the allegation that American Can violated the hearing conservation program provision in section 1910.95(b)(3). The United Steelworkers of America and its Local 1478 elected party status.

In all three cases, American Can filed motions to dismiss the complaints and vacate the citations on the grounds that the noise standard is invalid and that the allegations of violation are "wholly conclusory." American Can also requested, in the alternative, that the Secretary be required to furnish a more

---

1/ Section 1910.95 then stated in part:

§ 1910.95 Occupational noise exposure.

* * *

(b)(1) When employees are subjected to sound exceeding those listed in Table G-16, feasible administrative or engineering controls shall be utilized. If such controls fail to reduce sound levels within the levels of Table G-16, personal protective equipment shall be provided and used to reduce sound levels within the levels of the table.

* * *

(3) In all cases where the sound levels exceed the values shown herein, a continuing effective hearing conservation program shall be administered.

TABLE G-16--PERMISSIBLE NOISE EXPOSURES

| Duration per day, hours | Sound level dBA slow response |
|---|---|
| 8 | 90 |
| 6 | 92 |
| 4 | 95 |
| 3 | 97 |
| 2 | 100 |
| 1 1/2 | 102 |
| 1 | 105 |
| 1/2 | 110 |
| 1/4 or less | 115 |

* * *

Exposure to impulsive or impact noise should not exceed 140 dB peak sound pressure level.

(Footnote to table omitted.)

definite statement. Administrative Law Judge Goldstein denied American Can's motions in OSHRC Docket No. 76-5162 and ordered American Can to file an answer. American Can then requested that the judge certify his ruling for interlocutory appeal under former Commission Rule 75. 2/ The judge granted the request, certifying that "there is a substantial difference of opinion regarding the validity of the standard," and that an immediate appeal would obviate litigation concerning the development of the noise standard. In No. 78-4478, Judge Tenney denied the motion to dismiss and ordered American Can to file an answer. He then granted American Can's motion for a certification for interlocutory appeal. He characterized the controlling question of law as the "power of the Commission to review the rulemaking by the Secretary of Labor . . . and . . . whether the OSHA noise standard was validly adopted under OSHA." In No. 77-773, Judge Knight took under advisement the argument that the standard is invalid, but ordered the Secretary to file a more definite statement. Judge Knight then granted a motion by the Secretary to certify his ruling to the Commission. Judge Knight heard from the parties and was evidently informed by them that the interlocutory appeal certified by Judge Goldstein in No. 76-5162 raised a question substantially similar to that raised by his order requiring a more definite statement. He therefore certified to the Commission his order for a more definite statement.

We first clarify what issues are properly before us for review. The only issues before us in Docket Nos. 76-5162 and 78-4478 concern the validity of the

---

2/ Former Commission Rule 75, 29 C.F.R. § 2200.75 (1977), stated in part:

>
> * * *
>
> (c) Interlocutory appeal from a ruling of the judge shall be allowed as of right where the judge certifies that: (1) The ruling involves an important question of law concerning which there is substantial ground for difference of opinion; and (2) an immediate appeal from the ruling will materially expedite the proceedings.
>
> * * *

standard; Judges Tenney's and Goldstein's certifications identified only issues pertaining to the validity of the standards as warranting interlocutory review. The only issue raised by the certification in No. 77-773 is whether Judge Knight erred in ordering the Secretary to furnish a more definite statement; the judge did not certify the validity of the noise standard but rather took it under advisement.

II.

A.

A review of the regulatory background is important to an understanding of this controversy. In 1936, Congress passed the Walsh-Healey Public Contracts Act, 41 U.S.C. §§ 35-45 ("the Walsh-Healey Act"). Section 1(e) of the Walsh-Healey Act, 41 U.S.C. § 35(e), requires contracts with the federal government for materials in amounts over $10,000 to provide that "no part of such contract will be performed . . . under working conditions which are unsanitary or hazardous or dangerous to the health and safety of the employees engaged in the performance of said contract." That subsection also provides, however, that "Compliance with the safety, sanitary, and factory inspection laws of the State in which the work or part thereof is to be performed shall be prima-facie evidence of compliance with this subsection." Section 4 of the Walsh-Healey Act, 41 U.S.C. § 38, authorizes the Secretary of Labor to adopt rules and regulations to carry out the statute; the Administrative Procedure Act, 5 U.S.C. §§ 551-706 ("the APA"), is applicable to the making of these rules. Section 10 of the Walsh-Healey Act as amended in 1952, 41 U.S.C. § 43a.

Section 4(a) of the APA, 5 U.S.C. § 553(b), requires that a general notice of proposed rulemaking be published describing the terms or substance of a proposed rule or the subjects and issues involved; "interpretative rules" are exempted from this requirement unless a specific statute provides otherwise.

After the notice is published, interested persons are to be given an opportunity to submit written data, views or arguments. Section 4(b) of the APA, 5 U.S.C. § 553(c). "After consideration of the relevant matter presented, the agency shall incorporate in the rules adopted a concise general statement of their basis and purpose." Id.

On January 17, 1969, the Secretary published a revision of 41 C.F.R. Part 50-204, Safety and Health Standards for Federal Supply Contracts. 34 Fed. Reg. 788 (1969). The revision came after a proposed revision of Part 50-204 had been published and public comment invited. 33 Fed. Reg. 14258 (1968). A new Walsh-Healey noise standard was adopted at 41 C.F.R. § 50-204.10. 34 Fed. Reg. at 790-791. 3/ The Secretary stated that the new standards in the revised Part 50-204 were adopted "[a]fter consideration of all . . . relevant matter as was presented by interested persons" during a three-day period in November 1969. Id. at 788. The revision of Part 50-204 was to have been effective 30 days after its publication.

On February 14, 1969, the effective date of the revision was postponed until May 17, 1969, "to permit a careful review" of the new standards by the new Secretary of Labor. 34 Fed. Reg. 7946 (1969) (preamble); 34 Fed. Reg. 2207 (1969). On May 20, 1969, the Secretary amended the Walsh-Healey noise standard by adding a requirement that feasible administrative controls be used to reduce noise, and by substituting a provision that a "continuing effective hearing conservation program shall be administered" for an audiometric testing provision.

---

3/ The previous Walsh-Healey noise standard, section 50-204.293, stated that "Noise shall be reasonably reduced or eliminated as a means of preventing fatigue or accidents." 25 Fed. Reg. 13809 (1960). The new standard imposed a maximum exposure level of 90 decibels for 8 hours. It also required that feasible engineering methods be used to control noise levels, that personal protective equipment be used where feasible controls could not reduce noise to permissible levels, that employees be given audiometric tests in some circumstances and that the test results be made available to them. Administrative controls were not mentioned.

34 Fed. Reg. at 7946, 7948-9. The Secretary explained that he had given consideration to public comments received earlier and to the recommendations of an advisory committee composed of representatives of labor, management and public groups interested in occupational safety and health. On January 24, 1970, the Secretary also made some "minor amendments" to paragraphs (c) and (d) of the Walsh-Healey noise standard. 35 Fed. Reg. 1015 (1970).

The revised Part 50-204 also contained a general, introductory provision, section 50-204.1, entitled "Scope and Application." 34 Fed. Reg. at 788; 34 Fed. Reg. 7946. Section 50-204.1(a) explained the coverage of the Walsh-Healey Act and quoted the health and safety provision in section 1(e) of the Walsh-Healey Act, as well as the sentence that "Compliance with the safety, sanitary, and factory inspection laws of the State in which the work . . . is to be performed shall be prima-facie evidence of compliance with [subsection 1(e) of the Walsh-Healey Act]." Section 50-204.1(a) also stated that Part 50-204 "expresses the Secretary of Labor's interpretation and application of [subsection 1(e) of the Walsh-Healey Act] with regard to particular working conditions." Section 50-204.1(c) provided that "[w]henever any applicable standard in this Part 50-204 is relied upon by the Department of Labor in a formal enforcement proceeding . . . to support a finding of violation of the safety and health provisions of the Act and of a contract subject thereto, any respondent . . . shall have the right . . . to challenge the legality, fairness or propriety of any such reliance."

B.

The Occupational Safety and Health Act was passed on December 29, 1970, and became effective on April 28, 1971. Section 6(a) of the Act, 29 U.S.C. § 655(a), required that the Secretary, within two years, adopt as occupational safety and health standards under the Act "established Federal standards" and "national consensus standards" without following the rulemaking requirements of the APA or

of other subsections of section 6 of the Act. The Secretary was to do so unless he found that the adoption of a standard would not improve safety or health for specifically designated employees; in the event of a conflict among standards, the Secretary was required to adopt the most protective one. 4/ Section 3(10) of the Act, 29 U.S.C. § 652(10), defines "established Federal standard" as "an operative occupational safety and health standard established by any [federal] agency . . . and presently in effect, or contained in any Act of Congress in force on the date of enactment of this Act."

On May 29, 1971, the Secretary, acting under section 6(a), adopted many Walsh-Healey standards as occupational safety and health standards. 36 Fed. Reg. 10466 (1971). The Walsh-Healey noise standard was adopted and was codified as an occupational safety and health standard at 29 C.F.R. § 1910.95. Id. at 10466, 10518; 29 C.F.R. § 1910.99. The Secretary did not adopt any part of 41 C.F.R. § 50-204.1, the scope and application provision of 41 C.F.R. Part 50-204.

On that same day, the Secretary also amended 41 C.F.R. Part 50-204. 36 Fed. Reg. 9868 (1971). Among other things, the Secretary revoked 41 C.F.R. § 50-204.1(c). The Secretary's explanation for the amendments relied on the last sentence

---

4/ Section 6(a) states:

> Without regard to chapter 5 of title 5, United States Code, or to the other subsections of this section, the Secretary shall, as soon as practicable during the period beginning with the effective date of this Act and ending two years after such date, by rule promulgate as an occupational safety or health standard any national consensus standard, and any established Federal standard, unless he determines that the promulgation of such a standard would not result in improved safety or health for specifically designated employees. In the event of conflict among any such standards, the Secretary shall promulgate the standard which assures the greatest protection of the safety or health of the affected employees.

of section 4(b)(2) of the Act, 29 U.S.C. § 653(b)(2), which states that "Standards issued under the [Walsh-Healey Act] . . . and in effect on or after the effective date of the this Act shall be deemed to be occupational safety and health standards issued under this Act, as well as under such other Acts." 5/ The Secretary explained that an occupational safety and health standard is "a substantive rule, i.e., a rule having the force and effect of law." He reasoned that because the last sentence of section 4(b)(2) made the Walsh-Healey standards substantive rules, they ought to be revised to reflect their new nature.

III.

A.

American Can has argued before the Commission and its judges that the OSHA noise standard is invalid for two reasons.

First, American Can argues that the OSHA noise standard was invalidly adopted under section 6(a) of the Occupational Safety and Health Act. It maintains that the Secretary's failure to adopt the scope and application provision that had accompanied the Walsh-Healey noise standard made the OSHA noise standard impermissibly different in substance. American Can reasons that under the

---

5/ Section 4(b)(2) states:

> The safety and health standards promulgated under the Act of June 30, 1936, commonly known as the Walsh-Healey Act (41 U.S.C. 35 et seq.), the Service Contract Act of 1965 (41 U.S.C. 351 et seq.), [the Contract Work Hours and Safety Standards Act, usually known as the Construction Safety Act,] Public Law 91-54, Act of August 9, 1969 (40 U.S.C. 333), [the Longshoremen's and Harbor Workers' Compensation Act,] Public Law 85-742, Act of August 23, 1958 (33 U.S.C. 941), and the National Foundation on Arts and Humanities Act (20 U.S.C. 951 et seq.) are superseded on the effective date of corresponding standards, promulgated under this Act, which are determined by the Secretary to be more effective. Standards issued under the laws listed in this paragraph and in effect on or after the effective date of this Act shall be deemed to be occupational safety and health standards issued under this Act, as well as under such other Acts.

Walsh-Healey scope and application provision, a government contractor could have challenged the "legality, fairness or propriety" of the Labor Department's reliance upon the standard. "Thus, the Walsh-Healey Act noise standard did not purport to impose any rigid requirements. . . . [It] was drafted to allow for flexibility in its application to particular circumstances." American Can maintains that by contrast the OSHA noise standard has "drastically altered [the Walsh-Healey noise standard] by omitting this crucial language." American Can also points to the Secretary's failure "to incorporate the Walsh-Healey Act provision that compliance with state law 'shall be prima-facie evidence of compliance' with the [Walsh-Healey Act]." It argues that these omissions amounted to an alteration of the duties imposed by the Walsh-Healey noise standard and therefore violated the principle that in adopting an established federal standard under section 6(a), the Secretary was not permitted to alter its substance.

Second, American Can argues that the OSHA noise standard is invalid because the ancestor Walsh-Healey noise standard is invalid. It maintains that the Secretary was required by section 4(b) of the APA, 5 U.S.C. § 553(c), to incorporate into the Walsh-Healey regulations "a concise general statement of their basis and purpose" and that the Secretary failed to do so. It reasons that the derivative OSHA noise standard is therefore also invalid.

The Secretary argues that American Can's invalidity arguments are not properly before the Commission. He argues that section 6(f) of the Act, 29 U.S.C. § 655(f), 6/ provides the exclusive means for challenging the validity of

---

6/ Section 6(f) states:

> Any person who may be adversely affected by a standard issued under this section may at any time prior to the sixtieth day after such standard is promulgated file a

(cont'd)

an occupational safety and health standard, and urges that we overrule Commission decisions to the contrary. The Secretary and the United Steelworkers argue in addition that the Commission should not overturn an OSHA standard on the ground that the Walsh-Healey standard from which it was derived was invalidly adopted.

Both the Secretary and the United Steelworkers argue that the OSHA noise standard is valid in any event. They maintain that the application and scope provisions in 41 C.F.R. § 50-204.1 that were not adopted under the Act were not substantive provisions that the Secretary was required to adopt. They maintain that the application and scope provisions were not "occupational safety and health standards" as defined in section 3(8) of the Act, 29 U.S.C. § 652(8), because they did not "require" conditions or practices "reasonably necessary or appropriate to provide safe or healthful employment . . . ." 7/ Therefore, they reason, the Secretary was not even permitted to adopt them. The Secretary also argues that Congress desired that the Secretary adopt uniform national standards

---

(Footnote 6 cont'd)

> petition challenging the validity of such standard with the United States court of appeals for the circuit wherein such person resides or has his principal place of business, for judicial review of such standard. A copy of the petition shall be forthwith transmitted by the clerk of the court to the Secretary. The filing of such petition shall not, unless otherwise ordered by the court, operate as a stay of the standard. The determinations of the Secretary shall be conclusive if supported by substantial evidence in the record considered as a whole.

7/ Section 3(8) states:

> The term "occupational safety and health standard" means a standard which requires conditions, or the adoption or use of one or more practices, means, methods, operations, or processes, reasonably necessary or appropriate to provide safe or healthful employment and places of employment.

under the Act and that it could not have desired that the Secretary adopt a provision giving great weight to various state laws.

The Secretary and the United Steelworkers also maintain that the basis and purpose of the Walsh-Healey noise standard are obvious from its rulemaking history, particularly the course of changes it underwent. The United Steelworkers point to "the obvious administrative intent to eliminate 'working conditions which are unsanitary or hazardous or dangerous to the health and safety of employees [under section 1(e) of the Walsh-Healey Act].'"

B.

In No. 78-4478, Judge Tenney held first that inasmuch as American Can's "collateral" attack upon the OSHA noise standard is based on "essentially procedural" arguments, it cannot now be entertained. The judge cited National Industrial Constructors, Inc. v. OSHRC, 583 F.2d 1048, 1052 (8th Cir. 1978). Judge Tenney found that the attacks upon the standard lack merit in any event. He stated that although the OSHA noise standard is "substantively different" from the Walsh-Healey noise standard, "this is precisely what Congress intended." The judge noted that when the Secretary amended 41 C.F.R. Part 50-204 on May 29, 1971, the Secretary interpreted the last sentence of section 4(b)(2) as having changed "by operation of law" the nature of the Walsh-Healey standards from interpretative rules to substantive rules, and having in effect rendered 41 C.F.R. § 50-204.1 inoperative under the Walsh-Healey Act. Judge Tenney gave weight to the Secretary's view. Finally, Judge Tenney reasoned that for the Secretary to have adopted the state law and the "legality, fairness or propriety" provisions of 41 C.F.R. § 50-204.1(a) and (c) "would . . . have been difficult to reconcile . . . [with] the treatment of Federal-State regulations prescribed under section 18 of the [the Act], 29 U.S.C. § 667, and the express provision for variances (waivers) from safety rules in section 6(d) [of the Act], 29 U.S.C. § 655(d)."

Judge Tenney also concluded that any failure to comply with the basis and purpose requirement of the APA did not invalidate the Walsh-Healey standard. He was of the view that the Walsh-Healey standard was merely an interpretative rather than a substantive rule because it interpreted the health and safety clause of section 1(e) of the Walsh-Healey Act. Judge Tenney held that the APA's requirement of a statement of basis and purpose does not apply to interpretative rules.

Judge Goldstein held in No. 76-5162 that the case is controlled by Turner Co., 76 OSAHRC 108/A2, 4 BNA OSHC 1554, 1976-77 CCH OSHD ¶ 21,023 (No. 3635, 1976), rev'd on other grounds, 561 F.2d 82 (7th Cir. 1977).

IV.

Some of these issues have recently been settled. In Rockwell International Corp., 80 OSAHRC 118/A2, 9 BNA OSHC 1092, 1094-7, 1980 CCH OSHD ¶ 24,979, pp. 30,843-5 (No. 12470, 1980), the Commission held that it is generally authorized to consider the validity of occupational safety and health standards. Although we examined the employer's argument that the standard cited there is invalid because it is different in substance from the established federal standard from which it was derived, we reserved decision on whether a challenge to the procedural regularity of the adoption of the ancestor standard itself would be considered.

Shortly thereafter we considered the issue that Rockwell left open. In General Motors Corp., 81 OSAHRC 13/C10, 9 BNA OSHC 1331, 1981 CCH OSHD ¶ 25,202 (No. 79-4478, 1981), the Commission thoroughly examined all aspects of the matter, and held that the validity of the procedures by which Walsh-Healey standards were adopted under the Walsh-Healey Act may not now be challenged. General Motors disposes of American Can's argument that the OSHA noise standard is invalid because the Walsh-Healey noise standard lacked a statement of basis

and purpose when it was adopted under the Walsh-Healey Act. We therefore turn to a question of first impression: Is the OSHA noise standard impermissibly different in substance from the Walsh-Healey noise standard?

First, we find it difficult to say what, if any, change occurred when the Secretary did not adopt the "legality, fairness or propriety" provision in 41 C.F.R. § 50-204.1(c). American Can argues that the omission "drastically altered" the noise standard because it was no longer "flexibl[e] in its application to particular circumstances" but was instead rendered "absolute." This considerably overstates the matter. The application of all OSHA standards derived from Walsh-Healey standards is qualified under the Occupational Safety and Health Act in ways that afford flexibility to employers.

Section 6(d) of the Act, 29 U.S.C. § 655(d), requires the Secretary to grant a variance from a standard if a different means of protection will provide workplace conditions as safe and healthful as those that would prevail if the standard were strictly followed; the Secretary has used this power to afford substantial flexibility in the application of standards. 8/ Even where a variance application would be inappropriate, employers need not comply strictly with a standard if to do so would be more hazardous than noncompliance and if available alternative protective measures are taken. 9/ Similarly, where strict compliance with a standard is physically impossible or would prevent performance of the work, employers may instead take alternative protective measures. 10/ Employers also

---

8/ See e.g., Grant of Variance to General Motors Corp., 45 Fed. Reg. 46922, 1 BNA OSHR Reference File 35:1311, 1979-80 CCH Emp. S. & H. Guide Developments ¶ 12,032 (1980)(variance from lead and arsenic standards).

9/ See, e.g., General Electric Co., 77 OSAHRC 37/A2, 5 BNA OSHC 1186, 1977-78 CCH OSHD ¶ 21,658 (No. 12063, 1977), aff'd, 576 F.2d 558 (3d Cir. 1978).

10/ See, e.g., M.J. Lee Constr. Co., 79 OSAHRC 12/A2, 7 BNA OSHC 1140, 1146-7, 1979 CCH OSHD ¶ 23,330, p. 28,230 (No. 15094, 1979).

need not abate violative conditions if the hazards are de minimis, i.e., too trifling to warrant an abatement order or penalty, 11/ nor are employers held liable for violations caused by unpreventable acts of their employees. 12/ The Commission also considers the difficulties of compliance caused by the possible constructions of a standard when it chooses one construction over another. 13/ And finally, the most important duty imposed by the OSHA noise standard itself--the duty to provide engineering or administrative controls of excessive noise--is expressly qualified by the word "feasible."

We are therefore unconvinced that the omission of the phrase "legality, fairness or propriety" in 41 C.F.R. § 50-204.1(c) "drastically altered" the application of the Walsh-Healey standards. Indeed, we cannot be sure what, if any, change has occurred. American Can speculates that government contractors need not have complied with the Walsh-Healey standards "if compliance . . . would have interfered with plant operations, been unduly expensive, or simply unwarranted under the circumstances." But this is only speculation. Given the flexibility of application of standards under the Occupational Safety and Health Act, American Can's speculation is not sufficient ground for invalidating the OSHA noise standard.

There is a more fundamental reason for our rejection of American Can's argument, however. It is possible that the application of the noise standard under the Occupational Safety and Health Act differs in some respects from its application under the Walsh-Healey Act. We are nevertheless of the view that,

---

11/ See, e.g., Southwestern Electric Power Co., 80 OSAHRC 81/C7, 8 BNA OSHC 1974, 1980 CCH OSHD ¶ 24,730 (Nos. 77-3890 & 77-3391, 1980). The last sentence of § 9(a) of the Act, 29 U.S.C. § 658(a), defines a de minimis violation as one that has "no direct or immediate relationship to safety or health."

12/ See, e.g., Texland Drilling Corp., 80 OSAHRC 106/C13, 9 BNA OSHC 1023, 1980 CCH OSHD ¶ 24,954 (No. 76-5307, 1980).

13/ See Ormet Corp., 81 OSAHRC 35/C3, 9 BNA OSHC 1828, 1831 (No. 76-4398, 1981).

to whatever extent its application does differ, the substance of the noise standard was not impermissibly changed.

Although it is true as a general principle that a standard adopted under section 6(a) may not be different in substance from the established federal or national consensus standard from which it was derived, this is only a general principle. Some changes are permissible. For example, in Bechtel Power Corp., 76 OSAHRC 38/E2, 4 BNA OSHC 1005, 1008, 1975-76 CCH OSHD ¶ 20,503, p. 24,500 (No. 5064, 1976), aff'd, 548 F.2d 248 (8th Cir. 1977), we examined the legislative history of section 6(a) of the Act and concluded that Congress authorized the Secretary to summarily expand the scope of established federal standards to employers not originally covered by them. We therefore held that the Secretary was not required to adopt scope and application provisions of standards originally adopted under the Construction Safety Act. 14/ We have also held that the Secretary was not required to adopt under the Act effective date provisions of established federal standards, but could instead establish new ones. See Underhill Construction Corp., 75 OSAHRC 32/B8, 2 BNA OSHC 1556, 1974-75 CCH OSHD ¶ 19,276 (No. 1307, 1975), aff'd, 526 F.2d 53 (2d Cir. 1975).

American Can argues that the above cases are not dispositive here because the modifications at issue in those cases "did not change the requirements imposed on employers; they simply enlarged the class of employers subject to the preexisting standard." Regardless of American Can's interpretation of those cases, it nevertheless remains that changes in a source standard are permissible if they are the sort of changes that Congress allowed the Secretary to make. The changes American Can points to here are of that sort.

---

14/ See also Brown & Root, Inc., 81 OSAHRC 17/D14, 9 BNA OSHC 1407, 1981 CCH OSHD ¶ 25,226 (No. 77-805, 1981)(Longshoremen's and Harbor Workers' Compensation Act standards not limited to persons originally subject to them); Lee Way Motor Freight, Inc., 74 OSAHRC 22/D12, 1 BNA OSHC 1689, 1691, 1973-74 CCH OSHD ¶ 17,693, p. 22,088 (No. 1105, 1974), aff'd, 511 F.2d 864, 869 (10th Cir. 1975)(same as to Walsh-Healey standards).

We observed in General Motors that "[t]he drafters of the Act were aware that the then recently-adopted Walsh-Healey standards would be the primary source of established federal standards for industrial working conditions covered by the Act." 15/ However, there is no express evidence in the Act or its legislative history that Congress formed a specific intent on whether the Secretary also had to adopt provisions like those in 41 C.F.R. § 50-204.1(a) and (c). One section of the Act does suggest that Congress was thinking of rather conventional safety and health regulations. Section 3(8) defines "occupational safety and health standard" as a standard that "requires" conditions or practices--a description that does not easily fit the scope and application provisions of 41 C.F.R. § 50-204.1. Nevertheless, section 3(8) does not demonstrate congressional intent so clearly that our inquiry can end there. As American Can points out, too narrow a reading of section 3(8) would mean that an exemptory provision within a standard could have been deleted by the Secretary. We must therefore go on to ascertain the legislative intent by starting from the areas where the legislative intent is discernible, and project to fair and reasonable corollaries of that intent for the issue before us. See Montana Power Co. v. F.P.C., 445 F.2d 739, 746 (D.C. Cir. 1970) (en banc), cert. denied, 400 U.S. 1013 (1971).

We first examine the role that the phrase "legality, fairness or propriety" in 41 C.F.R. § 50-204.1(c) played under the Walsh-Healey Act. The Department of Labor evidently did not treat a violation of a Walsh-Healey standard as necessarily amounting to a breach of the contractor's duty under section 1(e) to provide working conditions that are not "unsanitary or hazardous or dangerous." Although Labor Department employees were instructed by section 50-204.1(b) to "treat a failure to comply with . . . any of the safety and health measures contained in

---

15/ 9 BNA OSHC at 1335-6 & n.13, 1981 CCH OSHD at p. 31,122 & n.13.

this Part 50-204 as resulting in working conditions which are 'unsanitary or hazardous or dangerous . . .' within the meaning of section 1(e) of the [Walsh-Healey] Act," an exception was provided "in the conduct of formal enforcement proceedings." Subsection (c) provided the rule for formal enforcement proceedings: The standard allegedly violated would be "relied upon by the Department of Labor . . . to support a finding of violation of the safety and health provisions of the [Walsh-Healey] Act," i.e., the requirement of section 1(e) that working conditions not be "unsanitary or hazardous or dangerous." The charged contractor would then have the opportunity to challenge the "legality, fairness or propriety of any such reliance." In short, a contractor was permitted to challenge the reliance upon a standard to show that a working condition was "unsanitary or hazardous or dangerous." The phrase "legality, fairness or propriety" in section 50-204.1(c) specially reflected and implemented the general criterion of section 1(e) of the Walsh-Healey Act.

It may also be that the phrase "legality, fairness or propriety" served another purpose: to permit the Secretary to judge whether the enforcement of a standard in a particular case would be unduly detrimental to the Government's contractual relationship. The purpose of the Walsh-Healey Act was to "eliminate the practice under which the Government is compelled to deal with sweat shops." 16/ Although the Labor Department set safety and health standards for Government contractors, enforcement was problematic. The only remedies available for safety and health violations were cancellation of the contract and contract debarment

---

16/ H.R. Rep. No. 2946, 74th Cong., 2d Sess. 4 (1936), quoted in Perkins v. Lukens Steel Co., 310 U.S. 113, 128 (1940). The Court stated that the Walsh-Healey Act's purpose was "to obviate the possibility that any part of our tremendous national expenditures would go to forces tending to depress wages . . . and offending fair social standards of employment." Id.

for three years (blacklisting). 17/ By providing for hearings on the fairness and propriety of relying upon the standards to judge the contractor's actions, the Secretary may have attempted to alleviate in adjudication some of the rigidity of the Walsh-Healey enforcement scheme. In short, section 50-204.1(c) may have helped the Secretary assure that the Government's contractual relationships would not be terminated lightly.

Although Congress expected the Secretary to adopt the Walsh-Healey standards under section 6(a), it provided him with an enforcement scheme very different from that of the Walsh-Healey Act. Instead of providing merely a general criterion like that in section 1(e) of the Walsh-Healey Act, Congress made the standards themselves the primary focus of an employer's duty. 18/ Instead of an inflexible enforcement scheme based upon the Government's contractual relationships, Congress provided a flexible scheme based upon its commerce power. 19/ Section 50-204.1(c),

---

17/ Sections 2 and 3 of the Walsh-Healey Act, 41 U.S.C. §§ 36 and 37. See 2 Fed. Reg. of Job S. & H. 9:3 (1981)(blacklisting only remedy, rarely used). See also N.Y. Times, Jan. 2, 1970, § 1, at 17, cols. 1, 4:

> Many observers have attributed the Labor Department's rare use of the sanction [blacklisting] to the feeling that it is too inflexible to impose in some instances, too drastic in others, and hence impractical in any.
>
> "It sure would help if we had some less serious penalties," one official said recently. "I'm not saying that we ought to do away with the blacklist, but we ought to have a fine or a court injunction or something more."

18/ See Brisk Waterproofing Co., 73 OSAHRC 30/E1, 1 BNA OSHC 1263, 1973-74 CCH OSHD ¶ 16,345 (No. 1046, 1973)(discussion of role of standards and the general duty clause). Congress viewed section 1(e) of the Walsh-Healey Act as akin to the Act's general duty clause. See S. Rep. No. 91-1282, 91st Cong., 2d Sess., at 10 (1970), and H. Rep. No. 91-1291, 91st Cong., 2d Sess., at 21 (1970), reprinted in Senate Committee on Labor and Public Welfare, 92d Cong., 1st Sess., Legislative History of the Occupational Safety and Health Act of 1970, at 150, 851 (1971).

19/ See the remarks of Representative Perkins explaining the conference bill to the House of Representatives, reprinted in Senate Comm. on Labor & Public Welfare, 92d Cong., 1st Sess., Legislative History of the Occupational Safety Health Act of 1970, 1204 (1971). Under the Act, the Secretary may issue citations, propose penalties, and seek injunctions against imminent dangers. Sections 9, 10 and 13, 29 U.S.C. §§ 658, 659 and 662.

which reflects the different approaches of the Walsh-Healey Act, would therefore have been more than anomalous under the Act. Its adoption would have introduced elements of an enforcement scheme that Congress found unsuitable for broadly regulating worker safety and health. We are therefore unconvinced that the Secretary was required, when he adopted the Walsh-Healey standards under section 6(a), to have specifically adopted 41 C.F.R. § 50-204.1(c).

We take a similar view of American Can's argument that by omitting the state law provision of section 1(e) of the Walsh-Healey Act quoted in 41 C.F.R. § 50-204.1(a), the Secretary made an impermissible change. The implication of American Can's argument is that the Secretary could not have adopted established federal standards without also adopting the statutes under which the federal standards were established. We think it highly unlikely that Congress intended to require such an odd state of affairs. As a practical matter, Congress' purpose was to supersede rather than perpetuate statutory schemes such as the Walsh-Healey Act's. Yet, the state law provision of section 1(e) reflects the peculiar features of the Walsh-Healey Act. It manifests not only the deference given to state law by the Walsh-Healey Act, but tied the effect of state law to the Walsh-Healey Act's generalized requirement that employees work in conditions that are not "unsanitary or hazardous or dangerous." By contrast, the Occupational Safety and Health Act made standards the primary focus of its enforcement scheme, and in section 18, 29 U.S.C. § 667, the state plan provision, allowed only state standards adopted under federally-approved state plans to supersede federal standards. For the Secretary to have adopted the state law provision of the Walsh-Healey Act would have circumvented for many industrial hazards the state plan provision of the Occupational Safety and Health Act. We cannot say that the Secretary was required, when he adopted the Walsh-Healey standards under section 6(a), to have specifically adopted the state law provision of the Walsh-Healey Act.

Accordingly, we have not been convinced by American Can that the Secretary's omission of 41 C.F.R. § 50-204.1(a) and (c) was impermissible and that the OSHA noise standard is invalid.

V.

The only matter remaining is Judge Knight's certification of his order in No. 77-773 requiring the Secretary to file a more definite statement.

The Secretary's complaint alleged that at various locations within an American Can plant, "feasible administative or engineering controls" were not in use. Judge Knight granted American Can's motion to require a more definite statement under Federal Rule of Civil Procedure 12(e). The judge required the Secretary to specify the feasible controls that American Can failed to use at each location. Judge Knight explained that he granted American Can's motion

> in an effort to force the parties--who, in light of the motion to dismiss and reply and the prior proceedings in similar matters probably know well what is in question--to identify from the beginning the issues of fact to be resolved so that problems of relevancy and materiality of proof as they arise during the period for discovery and at trial may be quickly disposed. This is especially true in complicated "noise" cases. For the judge, it is the essential purpose of the pleadings[;] and whatever discovery procedures the parties may employ to cure any deficiency in an otherwise legally sufficient pleading do not help him at all.
>
> In this case, the complaint which alleges that no controls were utilized becomes vague when the Secretary's reply to the motion to dismiss, etc., appears to indicate that some efforts to comply perhaps have been made. Hence, the factual situation is not clear and [American Can], if this is the case, cannot respond to the complaint in any meaningful manner. The proceeding is necessarily delayed and discovery must now be used to clarify the pleadings and identify the issue to be tried which should have been set out initially.

The issue here is whether the judge abused his discretion in ordering a more definite statement. 20/ We conclude that because the judge's reasons for

---

20/ Cf. Mitchell v. E-Z Way Towers, Inc., 269 F.2d 126, 130 (5th Cir. 1959)(federal district court).

ordering the more definite statement are inconsistent with the purpose of Federal Rule 12(e), he abused the discretion granted by the rule.

The purpose of a more definite statement is narrow. Federal Rule 12(e) permits a motion for a more definite statement if a pleading "is so vague or ambiguous that a party cannot reasonably be required to frame a responsive pleading." Contrary to the judge's view, Rule 12(e) is not designed to assist in trial preparation; that is the function of discovery. It was for this reason that Rule 12(e) was amended in 1940 to eliminate the phrase "or to prepare for trial." 21/ Similarly, it is not the purpose of Rule 12(e) to impose greater bounds on discovery than the liberal notice pleading scheme of the federal rules imposes. 22/ And contrary to American Can's argument, it is not necessary on a motion for a more definite statement to determine whether the complaint satisfies minimal pleading requirements; that may be determined by a motion to dismiss for failure to state a claim under Rule 12(b)(6). 23/

Finally, the judge erroneously found that the complaint became too vague to answer when the Secretary's reply to American Can's motion indicated that American Can had made some efforts at noise control. Our rules require American Can to answer the complaint that the Secretary filed, not allegations or representations outside it. The judge should have therefore focused upon the test stated in Rule

---

21/ See 2A Moore's Federal Practice ¶ 12.17 at 2369-2376 (1981); Wright & Miller, Federal Practice & Procedure: Civil § 1375 at 729-730 (1969); see, e.g., Mitchell v. E-Z Way Towers, Inc., 269 F.2d 126, 132 (5th Cir. 1959). See also Cement Asbestos Products Co., 80 OSAHRC 26/C7, 8 BNA OSHC 1151, 1155, 1980 CCH OSHD ¶ 24,343, p. 29,667 (No. 78-1054, 1980) (test is unintelligibility, not trial preparation).

22/ Cf. United States v. Georgia Power Co., 301 F. Supp. 538, 544 (N.D. Ga. 1969) ("Rule 12(e) is not designed to frustrate the concept of notice pleading.").

23/ See Wright & Miller, supra note 21, § 1376 at 732-3; Juneau Square Corp. v. First Wisconsin Nat. Bank, 60 F.R.D. 46 (E.D. Wisc. 1973).

12(e): Can an answer to the complaint reasonably be required to be framed? When the issue is so stated, the answer is clear.

American Can can reasonably be required to frame an answer. American Can understands that the Secretary alleges that it failed to use feasible controls to reduce noise. All it need do to answer this allegation is to ask itself whether this is so. If it believes that the allegation is true or false, it need only so state. If American Can lacks knowledge or information sufficient to form a belief as to the truth of the Secretary's allegation, it need only so state, and its statement will be treated as a denial. Fed. R. Civ. P. 8(b). Inasmuch as it could not be said that American Can cannot respond, even with a simple denial in good faith or without prejudice to itself, 24/ the motion for a more definite statement should not have been granted. 25/

Accordingly, the judge's rulings in Nos. 76-5162 and 78-4478 are affirmed. In No. 77-773, the judge's order is vacated; American Can shall answer the complaint within twenty days of this decision. The cases are remanded for further proceedings consistent with this opinion.

FOR THE COMMISSION

DATED: JAN 29 1982

Ray H. Darling, Jr.
RAY H. DARLING, JR.
EXECUTIVE SECRETARY

---

24/ Wright & Miller, supra note 21, § 1376 at 733.

25/ Chairman Rowland would not reach the question of whether Judge Knight abused his discretion, nor would he find whether American Can can reasonably be required to answer this complaint. It is sufficient to hold, for the reasons stated above, that the judge's approach was inconsistent with Rule 12(e). Because the disposition of American Can's motion is a matter committed to the judge's discretion, Chairman Rowland would vacate the judge's order but leave Judge Knight free on remand to reconsider the matter and to enter a new finding in light of the Commission's opinion.

COTTINE, Commissioner, concurring,

I concur in my colleagues' determination that the occupational noise standard was not shown to have been invalidly promulgated and that the judge's order granting American Can's Motion for More Definite Statement was in error. However, I conclude that no substantive change occurred in the promulgation of the earlier noise standard as an established federal standard under section 6(a) of the Act, 29 U.S.C. §655(a), because there was no change in the standard of care required by the standard.

I

The purpose of the Walsh-Healey Act is to ensure that federal contract monies do not go to "forces. . .offending fair social standards of employment," Perkins v. Lukens Steel Co., 310 U.S. 113, 128 (1940), and "that the Federal Government. . .procure and use only goods produced under safe and fair working conditions." George v. Mitchell, 282 F.2d 486, 493 (D.C. Cir. 1960). To this end, section 1(e) of the Walsh-Healey Act, provides with respect to federal procurement contracts as follows:

> (e) That no part of such contract will be performed nor will any of the materials, supplies, articles, or equipment to be manufactured or furnished under said contract be manufactured or fabricated in any plants, factories, buildings, or surroundings or under working conditions which are unsanitary or hazardous or dangerous to the health and safety of employees engaged in the performance of said contract. Compliance with the safety, sanitary, and factory inspection laws of the State in which the work or part thereof is to be performed shall be prima-facie evidence of compliance with this subsection.

41 U.S.C. §35(e).

A.

American Can claims that the Secretary's failure to adopt the following provisions from the scope and application section covering all Walsh-Healey standards rendered the adoption of the occupational noise standard, 29 C.F.R. §1910.95, invalid:

> Compliance with the safety, sanitary, and factory inspection laws of the State in which the work or part thereof is to be performed shall be prima-facie evidence of compliance. [41 C.F.R. §50-204.1(a)]
>
> * * *
>
> Whenever any applicable standard in this Part 50-204 is relied upon by the Department of Labor in a formal enforcement proceeding under section 5 of the Walsh-Healey Public Contracts Act to support a finding of violation of the safety and health provisions of the Act and of a contract subject thereto, any respondent in the proceeding shall have the right and shall be afforded the opportunity to challenge the legality, fairness or propriety of any such reliance. [41 C.F.R. §50-204.1(c)]

Respondent does not suggest that the Secretary altered the provisions of the noise standard itself when the source standard was adopted. Rather, it claims that the failure to also adopt the above cited provisions resulted in impermissible substantive changes in the cited standard, rendering its promulgation invalid under section 6(a) of the Act, 29 U.S.C. §655(a).

The portion of 41 C.F.R. §50-204.1(a) cited above that is referred to by American Can is taken out of context. The full text of the provision is as follows:

> §50-204.1 Scope and Application.
>
> (a) The Walsh-Healey Public Contracts Act requires that contracts entered into by any agency of the United States for the manufacture or furnishing of materials, supplies, articles, and equipment in any amount exceeding $10,000 must contain, among other provisions, a stipulation that "no part of such contract will be performed nor will any of the materials, supplies, articles, or equipment to be manufactured or furnished under said contract be manufactured or fabricated in any plants, factories, buildings, or surroundings or under working conditions which are unsanitary or hazardous or

> dangerous to the health and safety of employees engaged in the erformance of said contract. Compliance with the safety, sanitary, and factory inspection laws of the State in which the work or part thereof is to be performed shall be prima-facie evidence of compliance with this subsection." (sec. 1(e), 49 Stat. 2036, 41 U.S.C. 35(e)). This Part 50-204 expresses the Secretary of Labor's interpretation and application of this provision with regard to certain particular working conditions. In addition, §§50-204.27, 50-204.30, 50-204.31, 50-204.32, 50-204.33, and 50-204,36 contain requirements concerning the instruction of personnel, notification of incidents, reports of exposures, and maintenance and disclosure of records.

The portion cited by American Can is a quotation from the Walsh-Healey Act and the provisions that follow interpret and apply that statute. There is nothing in subsequent provisions of the Walsh-Healey regulations published by the Secretary of Labor to suggest that a government contractor would be permitted to comply with a state standard as an alternative to compliance with an applicable federal standard. The relevant portion of 41 U.S.C. §35(e) that is quoted in §50-204.1(a) merely provides that compliance with state laws "shall be prima facie evidence of compliance" with the requirement that federal contracts not be performed under "unsanitary or hazardous or dangerous" working conditions.

Decisions of the Department of Labor indicate that compliance with state requirements was not viewed as an acceptable substitute for compliance with federal standards promulgated under the Walsh-Healey Act. In finding the employer in violation of 41 U.S.C. §35(e) in Rushton Cotton Mills, it was concluded:

> Compliance with State standards constitutes but prima facie evidence of compliance with the health and safety stipulations of the Act. The conditions described. . .were below the basic safety and health standards set by the Administrator for establishments subject to the Act.

8 Wage & Hour Cases U.S. Labor Dep't 470, 479 (1948) (footnote omitted). Similarly, in Casey-Jones, Inc., 6 Wage & Hour Cases U.S. Labor Dep't 1137 (1946) the Wage and Hour Administrator stated:

> All that can be said for respondent's contention in this respect is that employers take a step in the right direction if they comply strictly with State health and safety requirements, but it cannot be said Congress intended such compliance would work an estoppel of the Federal Government's efforts to set a higher standard in factories engaged in performing its contracts. If Congress had so intended it could have so provided with equal facilities.

6 Wage & Hour Cases U.S. Labor Dep't at 1140.[1/] Accordingly, American Can's assertion that the Secretary's failure to adopt §50-204.1(a) amounted to a substantive modification of the noise standard because it altered an employer's compliance duties is without support.

The legislative history of the Occupational Safety and Health Act clearly indicates that the drafters intended a comprehensive national, occupational safety and health policy for all employees that would supersede what was considered to be an inadequate state-by-state approach to a serious national problem.[2/] Congress indicated its intent to ensure

---

1/ Section 50-204.1(b)(1), as revised on May 29, 1971, at 36 Fed.Reg. 9868, has incorporated these interpretations, stating, in pertinent part, the following:

> Evidence of compliance with the safety, sanitary, and factory inspection laws of a State in which the work, or part thereof, is performed will be considered prima facie evidence of compliance with the safety and health requirements of the Act, and of any contract subject thereto; and it shall be sufficient unless rebutted or overcome by a preponderance of evidence of a failure to comply with any applicable safety and health rules contained in this report.

2/ S.REP. No. 91-1281, 91st Cong., 2d Sess. 4 (1970), reprinted in SEN. COMM. ON LABOR & PUBLIC WELFARE, 92d CONG, 1st SESS., LEGISLATIVE HISTORY OF THE OCCUPATIONAL SAFETY AND HEALTH ACT OF 1970, at 144 (1971) ("LEGIS. HISTORY"); H.REP. No. 91-1291, 91st Cong., 2d Sess. 15 (1970), reprinted in LEGIS. HISTORY, at 845.

a minimum federal level of employee protection by requiring in the Act's state plan provision, 29 U.S.C. §667, that state standards be at least as effective as the federal standards they were to supersede.[3/] 29 U.S.C. §667(c)(2). Clearly a regulation purporting to permit compliance with various state standards as an alternative to compliance with federal standards, regardless of the basic level of protection afforded by the state standards and without the scrutiny required by the Act's state plan provision, would be inconsistent with the purposes and provisions of the Act.[4/] Accordingly, such a regulation could not be adopted under the Act.

B.

As noted by the majority, if working conditions were found to be "unsanitary or hazardous or dangerous," under the Walsh-Healey Act, the federal contractor would be in violation of section 1(e) of that statute. The available remedies were contract cancellation and/or blacklisting. 41 U.S.C. §§36 & 37. Under the Secretary's regulations, noncompliance with any safety and health measure contained in 41 C.F.R. Part 50-204 was treated as resulting in working conditions that were "unsanitary

---

3/ See S.REP. No. 91-1281, supra at 18, reprinted in LEGIS. HISTORY, at 158; H.REP. No. 91-1291, supra at 32, reprinted in LEGIS. HISTORY, at 862. This provision is not unique in comprehensive safety regulation. See 49 U.S.C. §1673(a), section 3(a) of the Natural Gas Pipeline and Safety Act. 49 U.S.C. §1671 et seq.; see Enserch Corp., d/b/a Lone Star Gas Co., OSAHRC , 10 BNA OSHC 1285, 1982 CCH OSHD ¶25,838 (No. 77-2289, 1981).

4/ Such a provision arguably could be nullified on that basis alone. See Manhattan Gen. Equip. Co. v. Commissioner of Internal Revenue, 297 U.S. 129 (1936).

or hazardous or dangerous" within the meaning of section 1(e). 41 C.F.R. §50-204.1(b). Section 50-204.1(c) of the Walsh-Healey regulations permitted a challenge to this finding to avoid harsh results. The regulation provides that whenever the Secretary relies on an applicable standard in Part 50-204 to support a violation of section 1(e) "any respondent in the proceeding shall have the right and shall be afforded the opportunity to challenge the legality, fairness or propriety of any such reliance."

American Can claims that under this regulation a contractor could challenge not only the legality of the standard but also its fairness and propriety. However, the provision clearly permits a challenge to the "legality, fairness or propriety" of the Secretary's reliance on a standard to find a violation and thereby impose sanctions, not a challenge to the standard. The flexibility afforded by the regulation applied to enforcement sanctions, not to the application of mandatory standards. The Secretary's failure to adopt section 50-204.1(c) as part of the OSHA regulations in no way affected the requirements of the noise standard. The regulation related to the unique enforcement scheme of the Walsh-Healey Act and simply had no relevance to enforcement of the Occupational Safety and Health Act with its less severe remedial measures[5/] and specific defenses relating to the particular cited conditions.[6/]

---

5/ See lead opinion, note 17 supra.

6/ See lead opinion, notes 8-13 and accompanying text supra.

C.

For these reasons I would reject American Can's assertion that the Secretary's failure to adopt Section 50-204.1(a) & (c) of the Walsh-Healey regulations as part of the OSHA regulations resulted in substantive modifications of the cited standard.

II

The majority concludes that the judge erred in granting American Can's Motion for More Definite Statement because his basis for granting the motion is inconsistent with Rule 12(e) and the notice-pleading theory of the Federal Rules of Civil Procedure.[7/] However, the Commission noted in Cement Asbestos Products Co., 80 OSAHRC 26/C7, 8 BNA OSHC 1151, 1980 CCH OSHD ¶24,343 (No. 78-1054, 1980), that in federal court proceedings Rule 12(e) must be read in conjunction with the federal rule on complaints, Fed.R.Civ.P. 8. Similarly, in Commission proceedings Rule 12(e) must be read with the Commission rule on complaints, 29 C.F.R. §2200.33(a)(2).[8/] Id.

---

7/ See lead opinion, quoted material preceding note 20 supra.

8/ Under 29 U.S.C. §661(f) and Commission Rule 2, 29 C.F.R. §2200.2, the Federal Rules of Civil Procedure apply only in the absence of an applicable Commission rule. Commission Rule 33(a)(2) provides:

> (2) The complaint shall set forth all alleged violations and proposed penalties which are contested, stating with particularity:
>
> (i) The basis for jurisdiction;
> (ii) The time, location, place, and circumstances of each such alleged violation; and
> (iii) The considerations upon which the period for abatement and the proposed penalty on each such alleged violation is based.

In granting the Motion for More Definite Statement the judge abused the discretion granted him by Commission Rule 66, 29 C.F.R. §2200.66. A motion for more definite statement seeks to cure unintelligibility in a pleading and is not a substitute for discovery. Cement Asbestos Products Co., supra. It is appropriate only where a complaint is so lacking in its description of the claim that an answer cannot be framed. The complaint in this case satisfies the requirements of Commission Rule 33(a)(2) and gives sufficient notice of the claim that an answer can be framed. See Id. Any additional information necessary to prepare its defense can be obtained by American Can during the course of discovery. Similarly, a pretrial conference is available to the judge to identify and narrow relevant issues. See Commission Rule 66(g), 29 C.F.R. §2200.66(g).

The judge's order granting the motion for more definite statement is properly vacated.

UNITED STATES OF AMERICA

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR,<br>Complainant,<br>v.<br>AMERICAN CAN COMPANY,<br>Respondent. | OSHRC<br>Docket No. 76-5162 |

ORDER ON RESPONDENT'S
REQUEST FOR INTERLOCUTORY APPEAL

Heretofore the Respondent filed a Motion (accompanied by a supporting memorandum) to Dismiss the Secretary of Labor's Complaint in this matter for the reason that the Occupational Safety and Health Administration Regulation in question - 29 CFR 1910.95(a) - is invalid. In response the Secretary submitted opposing arguments to the Respondent's Motion.

In order to afford the parties additional opportunity to advance further details in support of their respective theories of the case, oral argument was held in Chicago, Illinois on August 11, 1977. At these proceedings, unreported, the Secretary of Labor, the United Steelworkers of America, and the Respondent

were represented by counsel and presented their views regarding the validity of the standard.

On August 30, 1977, an Order was issued denying the Respondent's Motion to Dismiss the Complaint.

The Respondent now requests that an immediate interlocutory appeal from the Order be allowed.

Section 2200.75(c) of the Commission Rules of Procedure provides that:

> "Interlocutory appeal from a ruling of the Judge shall be allowed as of right where the Judge certifies that (1) the ruling involves an important question of law concerning which there is substantial ground for difference of opinion; and (2) an immediate appeal from the ruling will materiall expedite the proceedings. . . ."

In this matter, based upon the theory of the case as advanced by the Respondent, there is a substantial difference of opinion regarding the validity of the standard in issue. An immediate appeal will materially expedite the proceedings because a ruling on this point by the Commission will either terminate the matter or avoid extensive testimony and litigation concerning the development of this standard from its inception in the Walsh-Healy Act to its actual adoption by the Occupational Safety and Health Administration. In any event, the case will not be delayed because, as provided by Rule 75(d),

of the Petition shall not stay the current proceedings unless specifically ordered by the Commission.

Accordingly, the undersigned certifies that:

(1) the ruling involves an important question concerning which there is substantial ground for difference of opinion; and

(2) an immediate appeal from the ruling will materially expedite the proceedings.

The file is returned to the Commission.

| SECRETARY OF LABOR,<br>Complainant,<br>v.<br>S. ZARA & SONS CONTRACTING CO., INC.,<br>Respondent. | OSHRC Docket No. 78-2125 |

DECISION

Before: CLEARY and COTTINE, Commissioners.*/

BY THE COMMISSION:

A decision of Administrative Law Judge Jerome C. Ditore is before the Commission for review pursuant to section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). Judge Ditore modified the Secretary's amended citation which alleged that Respondent ("Zara") had committed a willful and repeated violation of the Act for failing to comply with the standard at 29 C.F.R. § 1926.651(c).1/ The judge concluded that the

---

*/ Chairman Rowland did not participate in this decision .

1/ This standard provides:

Subpart P Excavations, Trenching, and Shoring

* * *

§ 1926.651 Specific excavation requirements

* * *

(c) The walls and faces of all excavations in which employees are exposed to danger from moving ground shall be guarded by a shoring system, sloping of the ground, or some other equivalent means.

violation was repeated but not willful in nature, and he assessed a $3,000 penalty. Commissioner Cleary directed review of the judge's decision.[2/] We conclude that the judge erred in failing to find the violation willful in nature, and we assess a $5,000 penalty.

I.

The citation was issued after an employee of Zara was killed on March 24, 1978 in the collapse of a manhole excavation in which he had been working. This excavation was part of an extensive project for the installation of a sewer line which Zara was constructing for Nassau County, New York. The project had commenced in December 1977 and was still continuing at the time of the hearing in this case.[3/] It was under the management of a county engineer. The county engineer also served as project engineer and in that position supervised at least 20 inspectors whose responsibility was to ensure that work was done according to specifications. The specifications, which were contractual requirements imposed on the contractor, included a requirement that any excavation deeper than five feet be sheeted "as required" to protect employees and that trenches be adequately shored and securely braced or sheeted where required. The specifications permited the use of a trench

---

2/ Review was directed on the issue of whether the judge "erred by characterizing the violation . . . as repeated instead of willful." However, neither party takes exception to that part of the judge's decision finding the violation repeated, and there is no compelling public interest to warrant review of this finding. Accordingly, to the extent that the direction for review raises an issue with respect to the propriety of the finding of a repeated violation, we summarily affirm this portion of the judge's decision and accord it the precedential value of an unreviewed judge's decision. Stone & Webster Eng'r Corp., 80 OSAHRC 72/D11, 8 BNA OSHC 1753, 1754 n.1, 1980 CCH OSHD ¶ 24,646 at 30,235 n.1 (No. 15314, 1980).

3/ At the time of the hearing Respondent was operating seven projects with at least one superintendent on each project. The volume of the sewer construction work performed by Respondent over the past five years was estimated at $150 million, or about two million feet of sewer line. During that time, Respondent's total employment varied between 350 and 600 employees.

box to support an excavation less than 18 feet deep. However, trench boxes were not used in excavations having exposed utility lines that could be struck by the trench box as it was lowered into the excavation.[4/] Zara instructed its employees that in instances where a trench box was not used the excavation must be sloped. The foreman at the worksite where the fatal accident occurred, Benasutti, testified that he had been instructed to slope all four sides of an excavation to an angle of 45 degrees.

According to Ploska, the inspector assigned to monitor Benasutti's work, Benasutti normally used a trench box except where its use would not be practical due to the presence of utility lines. Prior to the accident, Benasutti consistently used a trench box. However, on the day before the accident, Benasutti encountered gas and water service lines as well as a curve in the road. Benasutti believed that use of a trench box in the vicinity of the utility lines would be hazardous and that the road curvature would impede installation of a box. Therefore, he decided to slope the excavation as an alternative to using the trench box. However, despite Benasutti's understanding of Zara's safety rule, he failed to slope the

---

4/ Both Tomasetti, a former safety director for Zara, and Huber, the shop steward for Zara's operating engineers, had personal knowledge of incidents in which gas lines ruptured by trench boxes had caught on fire, exploded, or resulted in the asphyxiation of workers. Similarly, Buckley, the business agent for the laborers' union, considered excavating near a service gas main to be hazardous because contact with a trench box could ignite the main. Papa, a county engineer, conceded that trench boxes cannot be used in close proximity to gas and water mains. Although the witnesses did not expressly state the hazards resulting from rupture of a water line, Tomasetti indicated that normally the water utility would shut off a water main on request if the service needs of the area would not be unduly affected and if a work crew were available. However, both Tomasetti and Benasutti, the foreman at the site where the fatality occurred, testified without rebuttal that the gas utility normally refused to shut off service. The county inspector assigned to Benasutti's worksite, Ploska, agreed that Benasutti could not continue to use the trench box because of "interference" from gas and water lines.

approximately 17-foot deep excavation to a 45-degree angle.[5/] Nor did he shore or otherwise support the excavation against collapse. The excavation caved in early the next day.

Benasutti's supervisor, job superintendent DiPaolo, previously had been contacted by a county officer concerning inadequately protected excavations. Dreyer, one of the county engineers supervising inspectors on the Zara project, testified that from inception of the contract until the day of the fatal accident, he made "just about" daily visits to Zara's worksites and had approximately five to ten conversations with either DiPaolo or his foremen regarding their failure to use an available trench box. On these occasions he advised DiPaolo or the foreman that without a trench box the excavation was hazardous. On December 22, 1977, he gave DiPaolo a written notice ordering Zara to use a trench box in any excavation deeper than six feet. This order was issued following Dreyer's observation of a trench, approximately 8 to 12 feet deep, without a box. The record does not indicate whether any of the excavations which Dreyer considered hazardous occurred at worksites under Benasutti's control.[6/]

---

5/ Ploska, the county inspector, testified that the excavation was sloped on the east and west sides but did not specify the degree of slope. The north face, which was used by employees for entrance and exit, was sloped 30-40 degrees from the vertical. The south face was almost vertical. According to Ornellas, the Secretary's compliance officer, the east side was sloped 22 degrees and the west side 18 degrees from the vertical. He gave the slope on the north face at between 45 and 60 degrees. The judge rejected Benasutti's testimony regarding the dimensions of the excavation as not credible and found that the east and west sides were sloped at less than 45 degrees from the vertical. The judge made no findings regarding the degree of sloping on the north and south faces. However, he determined that the soil composition of the excavation was predominantly loose sand and noted that the Secretary's standards require a slope of approximately 26 degrees from the horizontal, or approximately 64 degrees from the vertical, for such soil. Neither party excepts to these findings.

6/ DiPaolo supervised as many as 10 foremen and had a total of between 100 and 150 employees under his control.

On March 23, 1978, the day before the fatal accident at Benasutti's worksite, a trench at a worksite under the control of another foreman, Palumbo, collapsed. One of Zara's employees who was in the trench at a depth of 10 to 12 feet was slightly injured. The trench, which at that time was crossed by an exposed and active gas line, was not protected by either shoring or a trench box. During the morning before the cave-in as well as on prior days, Gallagher, the county inspector at the site, had repeatedly instructed Palumbo to use a trench box that was available at the site. According to Gallagher, Palumbo stated that a trench box was not "necessary." Gallagher further testified that after the accident Palumbo began using the trench box where its use was "feasible."

The Zara project at issue in this case was the first sewer project on which Dreyer had worked as a supervising engineer for the county. Similarly, Gallagher had never previously worked as a construction inspector. Ploska had no experience in construction work prior to his assignment as inspector on the Zara project. Neither Dreyer, Gallagher, nor Ploska had any familiarity with the Secretary's trench and excavation standards, nor had they received any formal safety training. On the other hand, Zara's general superintendent, Tomasetti, had been associated with Zara for eight years and had prior experience in sewer construction. He had received safety training from the gas utility, Long Island Lighting Company ("LILCO"), and the county and state departments of labor. He also had completed the Secretary's safety course in trenching and excavation.

Tomasetti previously had served as Zara's safety director and in this capacity, in 1974 or 1975, initiated Zara's safety program. The program included written safety rules and provided for the discussion of safety matters at annual general meetings of all company employees and at job meetings at construction sites with foremen and superintendents monthly or "as necessary." Superintendents and assistant superintendents also were required periodically to inspect and make a written

report on the safety and health conditions at worksites. Tomasetti made weekly or monthly inspections of all worksites accompanied by representatives of Zara's insurance carrier. According to Tomasetti, he discussed the Secretary's standards regarding sloping and shoring with foremen and superintendents and instructed them to use a trench box where practical and otherwise to slope. In Tomasetti's opinion, a trench box would be impractical in excavations where utility lines existed because of the possibility of damage to utility lines.

Zara's safety director, Trotter, was hired on May 31, 1977 to establish an internal insurance department and to continue implementation of the existing safety program. After his employment with Zara commenced, he took a course given by the county in trenching and excavation. This course was attended by 40 of Zara's foremen and superintendents. He and approximately 35 of Zara's employees also took LILCO's safety course. At the time of the hearing in this case, Trotter was attending a course in occupational safety and health standards at Hofstra University.

On October 28, 1977, Trotter first met with Zara's employees involved in trench and excavation work to discuss the Secretary's standards. According to Trotter, employees were generally instructed to use a trench box and customarily did so. If a box could not to be used, foremen were instructed to excavate to the proper angle of repose. Shoring equipment was available at the request of a foreman. Trotter and a representative of Zara's insurance department also conducted daily inspections of field sites. If an infraction of a safety rule was observed, it was photographed, brought to the attention of the employees, and discussed with the superintendent.[7/] Trotter arrived at the site here approximately five to ten

---

7/ Benasutti testified that he frequently saw Trotter at his jobsites; among other things, Trotter checked that a trench box was in use and examined the condition of the box.

minutes after the accident. At that time Benasutti told him that the excavation had been sloped in compliance with the standards.

During the past four years, Buckley, the business agent for the laborers' union, visited Zara's worksites three to five times. He noted that trench boxes or other shoring devices were always used where there was no danger of damaging a utility line. Similarly, the shop steward for Zara's operating engineers, Huber, who made daily visits to Zara's worksites, had never seen Zara fail to use a box where he felt one should have been used. He also had seen excavations sloped where no box was in use. On the other hand, Papa, a county engineer in charge of a Zara sewer project in progress at the time of the hearing and involved with Zara sewer projects since 1970, testified that on a few occasions Zara had failed to use a trench box in an excavation where Papa felt one should have been used. In each instance, Zara's superintendent would install a trench box when told to do so by Papa.

Finally, the record shows that during a five year period preceding the issuance of the citation here, Zara committed seven violations of standards pertaining to the shoring or sloping of trenches and excavations.[8/]

---

8/ Six prior citations, alleging violations of shoring or sloping requirements, were admitted into evidence by stipulation of the parties. All citations became final orders of the Commission prior to the inspection in this case. These prior violations may be summarized as follows:

Nonserious citation issued May 4, 1973: 29 C.F.R. § 1926.652(c) for failure to adequately support trenches more than five feet in depth and eight feet in length;

Nonserious citation issued June 6, 1973: § 1926.652(c) for failure to adequately support or slope trenches more than eight feet in length and five feet in depth (two trenches approximately seven and twelve feet deep);

Nonserious citation issued April 30, 1974: § 1926.652(b) for failure to adequately shore two trenches in that spacing of uprights and number of

(Cont.)

II.

Judge Ditore determined that Zara was aware of the requirements of the Act and had maintained a safety program including the issuance of "general" safety instructions and the provision of equipment for protecting employees in trenches and excavations. However, the judge found substantial deficiencies in the safety program, particularly with regard to the adequacy of the safety instructions. In the judge's view, employees were not specifically trained to recognize hazards that might be encountered at a worksite or in the methods of protecting against those hazards. Although safety responsibility was delegated to foremen and depended on the exercise of their judgement, Zara failed to give them detailed training on proper sloping or sloping methods. Employees received no training regarding soil conditions. Noting that Benasutti understood that the proper angle of slope was 45 degrees, the judge concluded that this instruction was insufficient considering the "myriad" conditions that may exist at an excavation site.

Nevertheless, the judge found that these deficiences in Zara's safety program did not constitute either an intentional or reckless disregard of, or plain indifference to, the requirements of the excavation and trench standards. He further

---

8/ (Cont.)

crossbraces was inadequate and § 1926.652(g)(1) in that cross braces used in another trench did not meet "minimum requirements";

Serious citation issued July 8, 1975: § 1926.652(d) in that sheeting and bracing was not effective to the bottom of the excavation resulting in "partial collapse" of one side;

Nonserious citation issued January 26, 1976: § 1926.651(c) in that an excavation 10 feet square and about 6 1/2 feet deep was not shored, sloped, or otherwise supported;

Serious citation issued January 26, 1976: § 1926.652(b) in that a trench approximately 30 feet long, 8 feet wide, and varying between 18 and 20 feet deep in unstable and sandy soil was not adequately shored, sheeted, braced, sloped, or otherwise supported; sheeting 40 inches in width was not properly spaced and lacked cross bracing.

found that Benasutti previously had used a trench box but could not continue to do so at the worksite in question because of interference from gas and water lines. Accordingly, he concluded that the violation was not shown to be willful in nature as alleged.

III.

On review, the Secretary contends that the judge erred in failing to find the violation willful. According to the Secretary, Zara had knowledge not only of the requirements of the Act but also of the need to improve its safety program as a result of the prior citations for substantially similar violations and the repeated warnings by the local inspectors that its employees were not adequately protected. The Secretary points out that the judge found numerous inadequacies in Zara's safety program and contends that, contrary to the judge's conclusion, a finding of willfulness is not precluded by the existence of a general safety program and the provision of safety equipment for some operations. In the Secretary's view, the facts establish either an intentional or reckless disregard of, or plain indifference to, the requirements of the Act. Finally, the Secretary asserts that in the light of all the circumstances, including prior violations and warnings, the gravity of the violation, and Zara's size, the maximum penalty of $10,000 is appropriate.[9/]

Zara argues that the judge's decision is supported by a preponderance of the evidence and should be affirmed. In support of its argument, Zara asserts that Benasutti decided in good faith to slope the excavation rather than endanger employees by using a trench box in the vicinity of utility service lines. Zara emphasizes that Benasutti had consistently used the trench box at this worksite until it was removed on this occasion. In Zara's view, the judge properly concluded

---

9/ 29 U.S.C. § 666(a) provides that an employer who willfully violates the Act or a standard issued under the Act may be assessed a civil penalty of up to $10,000.

that Benasutti's actions did not constitute an intentional or reckless disregard of, or plain indifference to, the requirements of the standard.

Zara also disputes the significance of the prior violations of the trench and excavation standards and the warnings by county personnel. According to Zara, the prior violations, with one exception, concern a standard different than the one at issue in this case and involved situations of substantial compliance with the shoring requirements rather than a complete absence of protective measures. As to the warnings by the county officers, Zara contends that their testimony should not be credited because they had not been adequately trained. Zara further contends that its safety officers, Tomasetti and Trotter, were better trained and qualified than the county personnel. Zara also submits that improvements in its safety program, implemented after the occurrence of the prior violations, demonstrate Zara's commitment to employee safety and its intention to comply fully with the requirements of the Act.

IV

A violation is willful in character if it was committed "with either an intentional disregard of or plain indifference to the Act's requirements." Mel Jarvis Construction Co., 81 OSAHRC 89/B13, 10 BNA OSHC 1052, 1981 CCH OSHD ¶ 25,713 (No. 77-2100, 1981) ("Mel Jarvis"). However, as stated in Mel Jarvis, a violation is not willful if an employer has a good faith opinion that the violative conditions conformed to the requirement of the standard. The test of an employer's good faith, for the purpose of determining willfulness, is an objective one, i.e., was the employer's belief concerning a factual matter or concerning the interpretation of a standard, reasonable under the circumstances. See Western Waterproofing Co. v. Marshall, 576 F.2d 139 (8th Cir. 1978), cert. denied, 439 U.S. 965 (1978).

The standard contained at section 1926.651(c) required Zara to slope, shore or provide equivalent means of protection in excavations where employees were exposed to

danger from moving ground. Under Commissioner Cleary's view, the factors set forth in section 1926.651(e) 10/ must be evaluated to determine the proper angle of repose for sloping a particular excavation. Commissioner Cleary concludes that an employer, reading section 1926.651(c) together with section 1926.651(e), could reasonably determine that a safety rule, predesignating the angle of repose in all excavations, was inadequate. Zara's safety rule required a 45 degree angle of repose in all excavations where a trench box was not used. Zara was aware that trench boxes could not be used in all excavations and that sloping was alternatively required. Zara did not instruct its employees to consider and apply the factors contained in section 1926.651(e) to determine the proper angle of repose. As a result, in sloping the excavation in question, Benasutti was unable to evaluate factors which affected the excavation's stability. The evidence also shows that Zara failed to instruct its employees in the methods by which a particular degree of sloping might be achieved. Zara's safety rule also failed to provide for shoring excavations in which a trench box was not used and where sloping was impracticable. Judge Ditore determined that Zara's sloping instruction was insufficient considering the "myriad" conditions that may exist at an excavation site. Based upon the foregoing rationale, Commissioner Cleary agrees with the judge's finding that Zara's safety rule failed to reasonably implement the cited standard's requirements in excavations where a trench box was not used.

Commissioner Cottine concurs in this result on different grounds. Section 1926.651(g) requires that "[a]ll slopes shall be excavated to at least the angle

---

10/ Section 1926.651(e) specifies that:

> The determination of the angle of repose and design of the supporting system shall be based on careful evaluation of pertinent factors such as: Depth of cut; possible variation in water content of the material while the excavation is open; anticipated changes in materials from exposure to air, sun, water, or freezing; loading imposed by structures, equipment, overlying material, or stored material; and vibration from equipment, blasting, traffic, or other sources.

of repose." "Angle of repose" is defined at section 1926.653 as "[t]he greatest angle above the horizontal plane at which a material will lie without sliding." Table P-1, accompanying the trenching and excavation standards, is entitled "Approximate Angle of Repose for Sloping of Sides of Excavation." It sets forth the maximum safe slopes for the soil compositions listed. 11/ Duane Meyer, d/b/a D.T. Construction Co., 79 OSAHRC 57/D4, 7 BNA OSHC 1560, 1561 n. 12, 1979 CCH OSHD ¶23,742 at p. 28,793 n. 12 (No. 16029, 1979). In Commissioner Cottine's view, walls of an excavation that do not comport with the angles of repose set forth in the table for the type of soil involved are not adequately guarded to prevent collapse and do not comply with the requirements of the excavation standards. Pipe-Rite Utilities Ltd., Inc., OSHRC Docket No. 79-234 (Jan. 28, 1982) (Cottine, Commissioner, dissenting). Furthermore, sections 1926.651(e) and (h) 12/ require that additional factors affecting the stability of the soil be considered when determining the degree of sloping necessary to guard against collapse.

Zara's safety rule requiring a 45 degree slope for all excavations in which a trench box is not used fails to take into consideration either the nature of the soil or other factors affecting its stability. 13/ Accordingly, Commissioner

---

11/ Angles of repose listed in Table P-1 for different soil classifications are as follows:

| | | |
|---|---|---|
| Solid Rock, Shale or Cemented Sand and Gravels | -- | 90° |
| Compacted Angular Gravels | -- | 63° 26' |
| Average Soils | -- | 45° |
| Compacted Sharp Sand | -- | 33° 41' |
| Well-Rounded Loose Sand | -- | 26° 34' |

12/ Section 1926.651(h) provides:

> (h) The angle of repose shall be flattened when an excavation has water conditions, silty materials, loose boulders, and areas where erosion, deep frost action, and slide planes appear.

13/ A 45 degree slope is steeper than the angle set forth in Table P-1 as the greatest angle above the horizontal at which either compacted sharp sand or well-rounded loose sand will lie without sliding. See Duane Meyer, d/b/a D.T. Constr. Co., supra. See note 11 supra.

Cottine agrees that the judge properly found Zara's safety rule to be inadequate.

We note further that Zara had been involved in the installation of sewer lines in Nassau County for five years prior to the fatal accident and during that period installed approximately two million feet of sewer line. Certain of Zara's supervisory personnel received specialized training in trenching and excavation which, in some cases, included instruction from the Secretary. Prior to the accident, Zara had violated not only the standard at issue here but also related trenching standards. 14/ Despite its extensive prior involvement in excavation, the training of its supervisors, and the fact that it had notice of the sloping and shoring requirements of section 1926.651(c) and related trenching standards from several prior citations, Zara failed to insure compliance with the cited standard in excavations where a trench box was not used. Zara's failure to take positive steps to insure compliance with the sloping and shoring requirements of the cited standard demonstrates at least a plain indifference to the standard and employee safety. Mel Jarvis, supra; Georgia Electric Co. v. Marshall, 595 F.2d 309 (5th Cir. 1979).

We are not persuaded by Zara's argument that the precautions, allegedly taken in good faith by Benasutti, preclude a finding of willfulness here. Because of the inadequacy of Zara's instructions, it was impossible for Benasutti to determine the proper angle of repose in the excavation where the accident occurred. We find that his belief that the excavation was sloped in compliance with the standard was not reasonable and, thus, not held in good faith. See Western Waterproofing Co.

---

14/ We reject Zara's challenges to the relevance of the prior violations. All of the prior violations involve standards pertaining to the shoring and sloping of excavations and trenches. Therefore, Zara should have been aware of the requirement to protect employees by shoring or sloping trenches and excavations regardless of whether the prior violations involved precisely the specific standard at issue in this case. See Georgia Elec. Co. v. Marshall, 595 F.2d 309 (5th Cir. 1979). Also, assuming, as Zara contends, that the prior violations predominantly involved situations of partial compliance with shoring requirements, Zara would still be put on notice that its safety program was not sufficient to prevent violations of these standards.

v. Marshall, supra. 15/ Accordingly, we reverse the judge and affirm a willful violation.

V

We now turn to the assessment of an appropriate penalty. Considering the factors contained in section 17(j) of the Act, 29 U.S.C. § 661(i), we find that, in view of the resultant fatality, the gravity of the violation is high. We further note that Zara is a large employer with a history of violations of trench and excavation standards. With respect to good faith, we find that, although Zara failed to implement the requirements of the cited standard, good faith efforts were expended in establishing a safety program and training certain supervisory personnel. In view of these efforts, we cannot agree with the Secretary's assertion that a $10,000 penalty is warranted in this case. On balance, we find a $5,000 penalty is appropriate.

Accordingly, the citation alleging a willful and repeated violation of the standard contained at 29 C.F.R. § 1926.651(c) is affirmed. A $5,000 penalty is assessed.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: JAN 29 1982

---

15/ Moreover, we find that Zara's safety rule, albeit inadequate, was not observed by Benasutti on the day of the accident. Although Benasutti's decision to remove the trench box appears justified, he was nevertheless required under Zara's safety rule to slope all sides of the excavation to an angle of 45 degrees. As Judge Ditore found, two of the sides of the excavation were sloped steeper than 45 degrees. The evidence further indicates that one of the other sides of the excavation was either unsloped or very inadequately sloped. Clearly, the sloping done by Benasutti in this case did not conform to the requirements of Zara's rule. Thus, even assuming that Zara's rule implemented the cited standard's requirements, the evidence does not support a finding that Benasutti's belief that the trench was properly sloped was reasonable. See Western Waterproofing Co. v. Marshall, supra.

Attorney for Complainant
by James A. Magenheimer, Esq., of Counsel

Erwin Popkin, Esq.
Suite 302, IBM Building
1399 Franklin Avenue
Garden City, New York 11530
Attorney for Respondent
by Gerald V. Dandeneau, Esq., of Counsel

## DECISION AND ORDER

Ditore, J.:

## PRELIMINARY STATEMENT

Respondent contested a citation for a willful violation of 29 CFR § 1926.651(c), and the proposed penalty of $10,000. Specifically, Respondent was charged with the willful failure

on March 24, 1978, to guard the walls of an excavation by shoring, sloping or other equivalent means to protect its employees working in the excavation.

Section 1926.651 which relates to specific excavation requirements, states in subsection (c) that:

> "[t]he walls and faces of all excavations in which employees are exposed to danger from moving ground shall be guarded by a shoring system, sloping of the ground, or some other equivalent means."

A hearing was held on October 30, 31 and November 1, 1978, at New York, New York.

## ISSUES

1. Whether a violation of 29 CFR § 1926.651(c) existed at Respondent's workplace on March 24, 1978.

2. If a violation existed, were any of Respondent's employees exposed to the hazard created by the violation.

3. If Respondent's employees were exposed, was the hazardous condition serious.

4. If the condition was serious, did Respondent know of the condition.

5. If Respondent knew of the condition, was it responsible for the violation.

6. If Respondent was responsible, was it a willful act on the part of Respondent.

7. If the violation was willful, is the proposed penalty reasonable and proper.

## STATEMENT OF THE EVIDENCE

### A. Background

From December 1977 through March 24, 1978, Respondent pursuant to a contract with the County of Nassau, State of New York, was constructing a lateral or center pipe sewer line (T. 20, 21, 24, 25, 142). The work was being performed by a number of Respondent's work crews. Each crew was assigned an inspector from the Department of Public Works of Nassau County. Each Nassau County inspector daily monitored the work being performed by Respondent's employees to ascertain whether the work was performed according to County specifications and whether safe trenching or excavation procedures were used (T. 18, 19, 26, 28, 29, 30, 63, 68, 69, 107-108, 141; Exh. C-1).

### B. The Incident of March 24, 1978

On the afternoon of March 23, 1978, between 3:30 and 4:30 p.m., one of Respondent's work crews began excavating an area of street adjacent to 110 Columbia Drive in Jericho, Long Island, for the installation of a manhole. The crew consisted of foreman George Benasutti, three laborers, Maia, Vespa and Rodriguez, a backhoe operator and an oiler (T. 111-112, 147, 445, 456, 457). In their prior excavation work on this project, Benasutti and his

crew utilized a steel trench box to protect against excavation cave-ins. Due to the presence of a lateral gas service line, a water pipe, and a slight curvature in the road bed, foreman Benasutti could not use the trench box at the Columbia Drive excavation (T. 113, 149, 446, 447).

On the morning of March 24, 1978, about 8:00 a.m., Benasutti and his crew continued their excavation for the manhole. After the backhoe finished its operation, Benasutti, Vespa and Rodriguez worked in the excavation laying a length of sewer pipe which would eventually be connected to, and 10 inches above the bottom of, the manhole. The trench box was not used, nor was the excavation shored or sheeted (T. 113, 118, 128, 129, 166, 167, 168, 169, 467, 469-470). Between 8:30 and 9:00 a.m., Maia, another laborer of the work crew, was standing at the top of, and looking down into, the excavation, directly over the area where Rodriguez was working in the excavation. He observed the right side wall of the excavation cave in, the water main break, and the excavation fill with water. He observed sliding sand push Rodriguez to the other side of the excavation and cover him up to his shoulders, and observed the water rise above Rodriguez's head. Benasutti and Vespa, at the other end of the excavation were able to escape (T. 166, 167, 173, 178, 180, 181, 182-186).

C. Dimensions of the Excavation and Soil Condition

Two eyewitnesses at the excavation at the time of the accident testified to the dimensions of the excavation and the nature of the soil.

George Maia, Respondent's laborer in Benasutti's work crew who was standing at the top right side of, and looking down into, the excavation when the accident occurred, estimated the excavation to be 17 feet wide, 17 feet deep, and 25 feet long. The excavation's walls were sloped like a "V", and the soil was sand (T. 169-171, 172, 173, 189, 190).

George Benasutti, Respondent's foreman, stated the road where the excavation was dug was 30 feet wide, and the excavation was 25 feet long. On the morning of March 24th, the excavation had been dug approximately 14 feet, another 3 feet had to be excavated to accomodate the manhole. The excavation's top or opening was two feet from the road curb on the water main or west side, and three feet from the east side curb. The width of the opening at the excavation's top was about 25 feet. The width of the bottom of the trench was about five feet. The soil was composed of sand with a little gravel and stone. Benasutti further stated that as his crew deepened the excavation they widened it (T. 452, 453, 454, 461, 462, 477, 478, 480-481).

On March 27, 1978, three days after the excavation accident, Mr. Benasutti made a written statement, signed and read by him, that the excavation was 30 feet long, 18 feet wide at road

level; and that the north and south sides of the excavations were sloped down to a trench portion of the excavation. The trench was 12 feet long, 6 feet deep and 5 to 6 feet wide. The exposed water main was 18 feet long, and 4 feet below road level. The east and west walls of the excavation were sloped (T. 462, 463; Exh. C-16).

George Plosko, the Nassau County inspector assigned to monitor Benasutti's work crew, stated that on the morning of March 24, 1978, the excavation was 17 feet deep, 6 or 7 feet wide at the bottom, 20 feet long and 20 or 25 feet wide at road level. His later testimony appears equivocal as to the "20 to 25" foot width. He estimated the north wall of the excavation was sloped 30 or 40 degrees. The south wall was not sloped. The east and west walls were sloped like a hill but less than 30 or 40 degrees. The west wall was one or two feet from the west road curb. The soil was of a "sandy nature, just sandy, small stones like a bank run" (T. 120, 124, 129, 155, 158-159, 160).

Joseph Ornellas, a compliance officer for OSHA investigated the worksite on March 24, 1979, about two hours after the accident occurred (T. 191, 193; Exhs. C-5 through C-8). Based on his observations and measurements, his conversations with Respondent's employees, Benasutti, Vespa and Maia, and on information as to the location of a water pipe, obtained from the Jericho Water District, Ornellas reconstructed the pre-accident dimensions of the excavation (T. 198-204, 208, 278-286; Exh. C-3).

His reconstruction figures revealed that the road bed was 30 feet wide from curb to curb; that 10 feet of road asphalt remained from the east curb to the east wall of the excavation; that prior to the accident, the west wall of the excavation was four feet from the west side road curb; that the width of the top of the excavation was 16 feet; that the excavation was 17 feet deep and 6 to 7 feet wide at the bottom; and that the excavation was about 25 to 30 feet long (T. 198-200, 201, 203-204, 208, 218-221, 222; Exh. C-3). George Ploska, the county inspector, stated that exhibit C-3 closely resembled the observations he made of the excavation on the morning of March 24, 1978 (T. 136).

Ornellas from his information and calculations, estimated that prior to the accident on the morning of March 24, 1978, the east wall of the excavation was sloped about 22 degrees from the vertical, the west wall was sloped about 18 degrees from the vertical. The soil was loose, sandy, and mixed with pebbles (T. 223-224, 229, 230). Based on his examination of the excavation's soil, he estimated the angle of repose* required the east and west walls of the excavation to be sloped between 45 degrees for average soil, to 64 degrees for well rounded loose soil, from a vertical plane, or 45 degrees to 26 degrees from a horizontal plane (T. 224-225, 229-234, 257-260, 262-264).

---

*The angle of repose is "the greatest angle above the horizontal plane at which a material will lie without sliding" 29 CFR § 1926.653(b).

Douglas Quick, president of a laboratory which tests soil, among other materials, stated that an analysis of the soil taken from the excavation adjacent to 110 Columbia Drive, indicated that the soil was average soil and the angle of repose for this type of soil was a one-to-one ratio, or an angle of repose of 45 degrees from a horizontal or vertical plane (T. 482, 485-489; see: 1926.652, Table P-1). The density analysis of the soil, i.e., the degree of compaction of the soil, indicated that the soil was loose but he did not think that this type of soil would collapse because of its density characteristics (T. 490, 491, 492).

D. Alleged Willful Nature of the Violation

Respondent received six prior citations (final orders) which involved either a failure on Respondent's part to shore, sheet or slope trenches or to adequately shore, sheet or slope trenches (T. 276-278; Exhs. C-9 through C-14).

There was testimony from three county inspectors, Jack Dreyer, George Ploska and James Gallagher, that on several occasions during Respondent's construction of the sewer line, Respondent had to be advised or informed to use adequate protective means in its trenches and excavations (T. 17, 44, 45, 47, 48, 50, 69-74, 79, 126).

George Ploska also stated that he worked closely with foreman Benasutti and his crew on this sewer project; that

Benasutti always used a trench box except on certain occasions, i.e., interference from water and gas lines, when the trench box could not be used; and that Benasutti was concerned with the safety of his men (T. 142-144).

Respondent maintains a general safety program and has a safety director. The duties of the safety director include issuing safety rules to, and conducting safety sessions with, Respondent's employees. The safety sessions include discussions on trench and excavation safety. Employees are instructed to use a steel trench box, or if that is not possible, to either sheet, shore or slope trenches and excavations. Respondent leaves it to the judgment of its foremen to determine whether a trench or excavation slope is sufficient or adequate for safety purposes (T. 326, 338, 340, 341, 347-348, 353-357, 359, 416, 421-422, 424-428, 430, 437-438, 449, 450; Exhs. R-1, R-8, R-9, R-10(a), R-10(b)). Respondent's instructions to its employees as to excavation and trench safety are general instructions; no specific instructions are given (T. 361-363). Foreman Benasutti stated that he was instructed at one of Respondent's safety meetings, if sloping was used, to slope each of the four walls of a trench to a 45 degree angle (T. 453-454). Respondent through its safety director, superintendents and foreman knew of OSHA standards concerning the protective requirements for trench and excavation safety (T. 340, 347, 349-350, 358, 411, 412, 423, 429-430, 450-451).

## OPINION

On the morning of March 24, 1978, prior to the accident, the excavation in which three of Respondent's employees were working, was not shored, sheeted or protected by any other device against the hazard of an excavation collapse. Respondent maintains that its foreman, Benasutti, sloped the east and west sides of the excavation to a one-to-one ratio, or to an angle of repose of 45 degrees above the horizontal plane.

The credible evidence establishes that the excavation prior to the accident was about 25 to 30 feet long, about 17 feet wide at road level, about 17 feet deep, and about 6 feet wide at the bottom. The east and west sides of the excavation were sloped like a "V" or at an angle of repose greater than 45 degrees above the horizontal plane. (See 29 CFR § 1926.653(b) and Table P-1.) The soil consisted of loose sand with a little gravel and stone.

Foreman Benasutti's testimony at the hearing conflicted with a written and signed statement he made three days after the accident (see Exh. 16). At the hearing, Benasutti testified that the excavation was about 25 feet wide at road level, about 14 feet deep and five feet wide at the bottom.

Prior to the accident Benasutti and his crew laid a stretch of pipe in the excavation. The pipe was to be connected ten inches above the bottom of a manhole that was to be installed at a depth of 17 feet, 10 inches. Since the pipe was laid at its

proper grade, the excavation had to be dug to a depth of at least 17 feet. This negates Benasutti's statement at the hearing that the depth of the excavation was about 14 feet. The witnesses Maia and Ploska estimated the pre-accident depth of the excavation to be about 17 feet.

Benasutti stated at the hearing, that prior to the accident, the excavation's top at road level was two feet from the west side road curb and three feet from the east side road curb. This left five feet of the original 30-foot width of the roadway undisturbed. Officer Ornella's actual measurement of the remaining roadway after the accident, revealed that 10 feet of roadway remained from the east curb to the east side or wall of the excavation, and from other data, ascertained that four feet of the roadway prior to the accident, remained from the west road curb to the west side of the excavation. Since the roadway was 30 feet wide, simple arithmetic indicates that the excavation was about 16 feet wide - 30 feet of original road minus 14 feet of remaining road. These figures approximate what the witnesses Maia and Benasutti (written statement) stated the width of the excavation was before the accident. Ploska's testimony as to the excavation's width was equivocal but he adopted Ornellas' sketch (Exh. C-3) as closely resembling the excavation's dimensions as he observed them on the morning of March 24, 1978.

If Benasutti's pre-accident estimates given at the hearing, that the width of the excavation at road level was about 25 feet;

that the depth was 14 feet; and that the east and west sides or walls sloped to 45 degree angles or a one-to-one ratio, it follows that the east side and west sides of the excavation had to be sloped back horizontally 14 feet at road level to correspond with the excavation's depth. This would total 28 feet of removed roadway width out of the original 30 feet*, and would approximate a 45-degree angle slope for the east and west walls of the excavation. However, Benasutti's calculations at the hearing, failed to take into account the 5 or 6 feet of width at the bottom of the excavation which when added to the 28 feet caused by the 45-degree slopes, would indicate that the excavation was 33 feet wide at road level or 3 feet wider than the road from curb to curb. There is no evidence that the excavation extended beyond the curb area to the sidewalks. Neither Respondent nor its witness Benasutti made any such claim. For the reasons given above, Benasutti's hearing testimony as to the pre-accident dimensions of the excavation is given no credence.

The evidence establishes that the excavation soil was loose sand with a little gravel and stone. This type of soil according to Table P-1 (following 29 CFR § 1926.652(g)) required that the east and west walls of the excavation be sloped to a two-to-one ratio, or at an angle of repose of 26 degrees above the horizontal plane. Respondent neither claimed or established that the east and west sides of the excavation were sloped to an angle of

---

*Benasutti also stated at the hearing, that the excavation was about 25 feet wide with 5 feet of roadway remaining - 2 feet on west side, 3 feet on east side.

26 degrees above the horizontal. Assuming arguendo, that the nature of the soil was such as to require a one-to-one ratio, or a slope of 45 degrees, the credible evidence establishes that the east and west side of the excavation were not sloped to a 45-degree angle from either the horizontal or vertical, but were sloped at an angle greater than 45 degrees from the horizontal.

Respondent inadequately sloped the excavation's east and west walls, and exposed its employee working in the excavation to a cave-in hazard. The hazard was serious in that it could, and did here, result in a fatal injury to an employee. Since Respondent places the responsibility upon its crew foreman to determine the adequacy of excavation and trench sloping, the foreman's knowledge is imputed to Respondent. Secretary of Labor v. F. H. Sparks of Maryland, Inc., 78 OSAHRC 13/C12, 6 BNA OSHC 1356, 1977-78 CCH OSHD para. 22,543 (Nos. 15472 and 15760, 1978). Respondent is responsible for the serious violation.

Respondent was charged with a willful violation of j29 CFR § 1926.651(c). "Willful" as defined by the Commission and a majority of Circuit Courts of Appeal is "an act done voluntarily with either intentional disregard of, or plain indifference to, the Act's requirements", or as an act "done knowingly and purposely" by someone who, "having a free will or choice, either intentionally disobeys the standard or recklessly disregards its requirements". Cedar Construction Company v. OSHRC, et al, No. 77-1538, slip op. pp 3-4 (D. C. Cir., October 20, 1978) and cases cited therein.

The evidence does not establish that Respondent either intentionally or recklessly disregarded or exhibited plain indifference to the Act's excavation and trenching safety requirements. Respondent is fully aware of the Act's requirements and has maintained a general safety program, and has held general safety instruction sessions with its employees. Respondent has provided steel trench boxes and other equipment for the purpose of protecting its employees engaged in excavation and trench work.

Unfortunately Respondent's general safety program and general instructions are inadequate to support its safety responsibilities under the Act. Respondent issues no specific enforced rules or instructions. Respondent gives no specific training to its employees concerning the specific or actual hazards that may be encountered at a jobsite, or the specific methods of guarding against the hazards. Respondent gives no detailed training to its crew foreman regarding sloping, or how to achieve proper sloping, and gives no training as to soil conditions, and other activities that they may in concert with soil conditions, create hazardous excavation conditions. Foreman Benasutti stated he attended a safety session held by Respondent where he was told, when sloping, to slope one-to-one or to an angle of 45 degrees. This instruction is woefully inadequate when considered with the myriad conditions that may exist at an excavation site,

and when considered with Respondent's delegation of safety responsibility for excavations and trenches to the judgment of its inadequately trained crew foremen.

These discrepancies and weaknesses in Respondent's safety program do not rise to the level of an intentional or reckless disregard, or a plain indifference to the Act's excavation and trench requirements. The evidence does not establish a willful violation of the standard herein but does establish a repeat violation.

Respondent's prior six citations which became final orders (Exhs. C-9 to C-14) reveal that in each of the six citations (four nonserious, two serious) there was one violation in which Respondent has either failed to shore, sheet or slope a trench, or failed to adequately sheet, shore or slope a trench. Although none of the previous six violations involved the specific standard here (29 CFR § 1926.651(c)), they were substantially similar i.e., failing to guard or adequately guard, trenches against cave-in hazards, to the violation and hazard here. Secretary of Labor v. Potlatch Corporation, OSHRC Docket No. 16183, decided January 22, 1979. The violation will be reduced to a repeat violation.

Based on all the circumstances of this case including the gravity and the repeat nature of the violation, and a consideration of all the statutory factors of section 17(j) of the Act, the proposed penalty of $10,000 is unreasonable and is reduced to $3,000.

## FINDINGS OF FACT

The credible evidence and the record as a whole establishes preponderant proof of the following specific findings of fact.

1. On March 24, 1978, pursuant to a contract with the County of Nassau, State of New York, Respondent was engaged in the construction of a lateral or center pipe sewer line.

2. On the morning of March 24, 1978, a work crew of Respondent consisting of foreman George Benasutti, three laborers, Maia, Vespa and Rodriguez, a backhoe operator and an oiler were working at, and in, an excavation located adjacent to 110 Columbia Drive, Jericho, Long Island. The excavation was being prepared for the installation of a manhole at a depth of 17 feet, 10 inches.

3. George Ploska, a Nassau County inspector, was assigned to Benasutti's work crew to monitor the work being done by the crew.

4. Benasutti, Vespa and Rodriguez were working in the excavation and had laid a stretch of pipe which was to be connected 10 inches above the bottom of the manhole which had not as yet, been installed.

5. The excavation was about 25 feet long, about 17 feet wide, about 17 feet deep and about 6 feet wide at the bottom. The east and west sides of the excavation were sloped at an angle greater than 45 degrees above the horizontal plane. The road bed from curb to curb (east to west) was 30 feet wide.

6. The soil of the excavation consisted of loose sand with some gravel, and required a sloping angle of at least 45 degrees above the horizontal plane.

7. The excavation was neither shored nor sheeted. A trench box, previously used, was not in use due to an interference from gas and water lines.

8. Between 8:30 and 9:00 a.m., on March 24, 1978, while Benasutti, Vespa and Rodriguez were in the excavation, the west wall collapsed trapping Rodriguez. The wall collapse caused the water main to break and flood the excavation, drowning Rodriguez. Benasutti and Vespa escaped without any mishap.

9. The excavation was inadequately sloped and did not comply with 29 CFR § 1926.651(c) and with the sloping requirements of Table P-1 (following 29 CFR § 1926.652(g)).

10. Respondent knew of the standard's requirements for excavation safety.

11. Respondent maintains a general safety program and holds general safety instruction sessions with its employees.

12. Respondent provides trench boxes and other materials to be used in protecting its employees against the hazards of excavation collapse.

13. Respondent does not maintain, or provide any specific and rigidly enforced safety instructions, rules, or training for its employees as to specific trench and excavation hazards they may encounter at a jobsite, and as to specific methods to be employed to protect against the hazards.

14. Respondent delegates to its crew foremen the responsibility to determine when a sloping method is to be used, and to determine, if sloping is used, whether it is adequate to protect Respondent's employees from the hazards of an excavation or trench collapse.

15. The evidence is insufficient to establish that Respondent either intentionally, or recklessly, or with plain indifference, disregarded OSHA's safety requirements for excavations and trenches.

16. Respondent on six prior occasions, received citations which became final orders, for violations substantially similar to the violation herein.

17. The prior six violations, four nonserious and two serious, involved situations where Respondent either failed to shore, sheet or slope a trench, or failed to adequately shore, sheet or slope a trench for the protection of its employees.

18. Respondent is responsible for the violation herein which was serious and repeat.

## CONCLUSIONS OF LAW

1. Respondent is, and at all times material herein was, engaged in a business affecting commerce within the meaning of section 3(5) of the Act (29 U.S.C. § 652(5)).

2. The Occupational Safety and Health Review Commission has jurisdiction over the subject matter and parties to this action.

3. On March 24, 1978, Respondent was not in willful violation of 29 CFR § 1926.651(c) but was in repeat violation of 29 CFR 1926.651(c) for failing to adequately slope an excavation in which its employees were working.

4. Under all the circumstances of this case with due consideration of all the statutory factors of section 17(j) of the Act, and of the repeat nature of the violation, the proposed penalty of $10,000 is unreasonable and is reduced to $3,000.

## O R D E R

Due deliberation having been had on the whole record, it is hereby

ORDERED that the citation for a willful violation of 29 CFR § 1926.651(c) is reduced to a repeat violation, and as reduced is affirmed, it is further

ORDERED that the proposed penalty of $10,000 is reduced to $3,000, and as reduced is affirmed.

DECISION

Before ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

An order of Chief Administrative Law Judge Paul A. Tenney is before the Commission for review pursuant to section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act").

On January 15, 1981, Chief Judge Tenney issued an order to Respondent, Better Baked Foods, Inc., to show cause within 10 days why its notice of contest should not be dismissed for its failure to file proof that it posted its notice of contest, as required by Commission Rule 7, 29 C.F.R. § 2200.7. On March 11, 1981, Chief Judge Tenney vacated Respondent's notice of contest for Respondent's failure to respond to his January 15th order.

On April 9, 1981, Respondent's General Manager Ralph W. Wilson sent a telegram to the Commission stating that although Commission records indicate that Respondent's mail clerk signed a receipt for Chief Judge Tenney's January 15, 1981 order, the General Manager never saw the order,

and has searched his records and can find no trace of it. He stated the failure to respond to the order was inadvertant and requested reinstatement of Respondent's notice of contest. On April 10, 1981, Commissioner Cleary granted Respondent's request for review.

Dismissal for failure to comply with the Commission's procedural rules is a matter for the judge's sound exercise of discretion but a decision on the merits rather than on a procedural flaw is favored. See Asarco, Inc., El Paso Div., 80 OSAHRC 99/A3, 8 BNA OSHC 2156, 1980 CCH OSHD ¶ 24,838 (No. 79-6850, 1980). Respondent requests reinstatement and offers an explanation for its failure to comply with the Commission's procedural rules. In order to give the parties an opportunity to present any evidence and argument about the requested reinstatement and to permit the judge to rule on it, we set aside the Chief Judge's dismissal and remand for appropriate further proceedings. SO ORDERED.

FOR THE COMMISSION

ORDER

There has been no response to the January 15, 1981, order to the extent in paragraph number 1 thereof it orders the employer to show cause why the notice of contest should not be dismissed for failure to comply with the Commission's rules concerning the service of the notice of contest upon affected employees or their authorized representative.

In light of the absence of a response the notice of contest is hereby vacated except to the extent that it puts in issue the contested proposed penalties. See Commission Rule 1(e) defining the term "affected employee". By the terms of this order there is no outstanding issue concerning the allegations of a hazard. Therefore, there is no prejudice to affected employees by continuing the contest as it relates to the proposed penalties.

The case shall be assigned for further proceedings.

DECISION AND ORDER

Appearances: Richard L. Collier, Esq., of Dallas, Texas, for the complainant.

Carl E. Clubb, safety director, of Indianapolis, Indiana, for the Respondent.

BLYTHE, Judge:

STATEMENT OF THE CASE

The sole issue in this case is whether the respondent, Huber, Hunt & Nichols, Inc., a general contractor, can be held responsible for a subcontractor's safety violations in view of the stipulated fact that none of respondent's employees was exposed to the hazards. This issue subsumes the question of whether the Secretary of Labor ("the Secretary") is bound by a Field Operations Manual provision against issuing citations to employers whose employees are not exposed.

After an inspection of respondent's workplace at 9201 Pan American Freeway, N.E., Albuquerque, New Mexico, on April 29, 1981, by a compliance officer

of the Occupational Safety and Health Administration ("OSHA"), one citation was issued to respondent May 4, 1981, alleging serious violations of §5(a)(2) of the Occupational Safety and Health Act of 1970 ("the Act") and safety standards for scaffolds codified at 29 CFR 1926 §§500(e)(1)(ii) and 451(c)(12). The citation was amended May 18, 1981, to allege a serious violation of 29 CFR 1926.451(a)(4) instead of 29 CFR 1926.500(e)(1)(ii). The respondent timely filed notice of contest May 22, 1981, thus initiating this proceeding before the Occupational Safety and Health Review Commission ("the Commission") under §10(c) of the Act. Thereafter respondent filed a request for simplified proceedings [1] which the Secretary did not oppose.

The case came on regularly for hearing in Albuquerque on September 4, 1981. No affected employee or authorized representative of affected employees participated. Respondent submitted a posthearing brief; the Secretary did not.

## DISCUSSION AND OPINION

At the workplace here involved, respondent, as general contractor, was constructing a large building on a 65-acre site for the Signetics Corporation. One of its subcontractors was Bob Davis Masonry, Inc. ("Davis"), which erected and used the two scaffolds which are the subject of the citation. Item 1a, as amended, alleges that "[h]andrails were not provided for the open ends and areas" of one of a 15-foot-high scaffold, in violation of 29 CFR 1926.

---

[1] See Rules 200-211 of the Commission's Rules of Procedure.

451(a)(4) [2], and item 1b alleges a violation of 29 CFR 1926.451(c)(12)[3] in that a scaffold 15 feet high and 48 feet long was not secured to the building.

In its posthearing brief, respondent does not contend that the violations did not exist. Rather, it contends, as previously stated, that it should not have been cited because its employees were not exposed to hazards created by its subcontractor.

The answer to this contention is found in Perini Corp., 78 OSAHRC 41/C5, 6 BNA OSHC 1609, 1978 CCH OSHD ¶22,772 (No. 13029, 1978), where the Commission held a general contractor responsible for safety violations it could prevent or abate by reason of its supervisory authority over a multi-employer workplace, regardless of whether it created the hazard or whether its own employees were exposed thereto.

Respondent points out that the Secretary's Field Operations Manual, CH. X(F)(1)(b)(1), provides:

> Citations under the general duty clause and under standards will be issued only against employers where their own employees are exposed or are potentially exposed to unsafe or unhealthful conditions.

(Emphasis supplied). The case law is well settled that the Field Operations Manual provides only guidelines for compliance officers and does not confer substantive rights on employers. Combustion Engineering, 77 OSAHRC 182/A2, 5 BNA OSHC 1943, 1979-78 CCH OSHD ¶22,241 (No. 76-2210, 1977).

---

[2] This standard provides:

> Guardrails and toeboards shall be installed on all open sides and ends of platforms more than 10 feet above the ground or floor...[with exceptions not here pertinent].

[3] This standard provides, with regard to tube and coupler scaffolds:

> To prevent movement, the scaffold shall be secured to the building or structure at intervals not to exceed 30 feet horizontally and 26 feet vertically.

Respondent further contends that "the violative conditions were not obvious to the casual observer, and would require almost moment-to-moment observation if they were to be discovered." (Brief, P.5). The scaffold on which guardrails were absent was about 100 feet directly in front of respondent's office and had been in use by Davis' bricklayers two days (Tr.14-15). The scaffold involved in item 1b adjoined the other on one end but was around a corner of the building and had also been used two days by Davis' employees (Tr.32).

Compliance Officer Ambrose Claus testified that the scaffold in item 1a was in plain view (Tr.16) and that the lack of a tie to the building on the scaffold in item 1b could be detected from a distance of 20 or 25 feet by looking between the scaffold and the building (Tr.35).

In Knutson Construction Co., 76 OSAHRC 131/F3, 4 BNA OSHC 1759, 1976-77 CCH OSHD ¶21,185 (No. 765,1976), aff'd., 566 F.2d 596 (8th Cir. 1977), the Commission held a general contractor responsible for detecting the lack of guardrails on a scaffold but not for a hidden crack which caused a scaffold to collapse but which the respondent could not reasonably be expected to detect or prevent.

It is clear that under Knutson the respondent here should have been able to detect the absence of guardrails. The absence of a tie-in to the building on the other scaffold is a closer question because it was not so obvious. However, I find that it was not unreasonable to expect respondent to detect the lack of a tie to the building.

Respondent's general superintendent and safety officer, Dan Holmberg, made daily tours of the project and weekly safety inspections (Tr.92,100). He had

never noticed any safety violations on the scaffolds here involved but if he had he would have required Davis to correct them, he testified (Tr.102). However, he said he just looked for obvious violations (Tr.102). This is not sufficient.

Respondent points out (Brief, P.2) that Davis' subcontract (Exhibit R-1) required Davis to furnish all scaffolding and supervision in connection with the masonry work. The contract also required Davis to comply with OSHA regulations and made it "responsible for any costs, damages or penalties that Huber, Hunt & Nichols, Inc., may suffer or incur as a result of any violation of such regulations by the subcontractor, his agents or employees". However, it is well settled that an employer cannot by contract absolve itself of its responsibilities under the Act. Bill C. Carroll Co., Inc., 79 OSAHRC____, 7 BNA OSHC 1806, 1979 CCH OSHD ¶23,940 (No. 76-2748, 1979).

I find the respondent in violation of both standards as charged and that these violations were serious. The compliance officer testified without contradiction that the likely result of a 15-foot fall from these scaffolds would be serious fractures (Tr.21).

There remains the assessment of an appropriate penalty, the Secretary having proposed an aggregate penalty of $360.

Section 17(j) of the Act requires the Commission, in assessing penalties, to consider the gravity of the violation and the employer's size, good faith and history of previous violations. These factors need not be accorded equal weight, but the gravity is usually of greater significance than the others. Colonial Craft Reproductions, 72 OSAHRC 11/B10, 1 BNA OSHC 1063, 1971-73 CCH OSHD ¶15,277 (No. 881,1972). Elements to be considered in determining gravity include the number of employees exposed to the risk of injury,

duration of the exposure, precautions taken against injury, and the degree of probability of occurrence of an injury. National Realty & Construction Co.,Inc., 72 OSAHRC 9/A2, 1 BNA OSHC 1049, 1971-73 CCH OSHD ¶15,188 (No. 85, 1972) rev'd on other grounds, 489 F.2d 1257 (D.C. Cir., 1973).

After considering these criteria, I find the proposed penalty of $360 appropriate.

## FINDINGS OF FACT

1. The respondent, Huber, Hunt & Nichols, Inc., is a large construction company which on April 29, 1981, was a general contractor engaged in the construction of a large building for Signetics Corporation at Albuquerque, New Mexico. It was engaged in a business affecting commerce and had employees within the meaning of §3(5) of the Act.

2. Two 15-foot-high tube and coupler scaffolds on this workplace erected and used by a subcontractor, Bob Davis Masonry, Inc., were in violation of 29 CFR 1926 §§451(a)(4) and 451(c)(12) in that one lacked guardrails on the open ends and at places left open for offloading materials and the other, which was 48 feet long, was not tied to the building.

3. It was reasonable to expect the respondent, in its supervisory capacity as general contractor, to detect these violative conditions and require them to be corrected. These conditions had existed two days prior to the inspection. The lack of guardrails was readily apparent, and the lack of a tie to the building could have been detected by a reasonably thorough safety inspection.

4. There was a substantial probability that death or serious physical injury could result from these vioaltions.

5. A penalty of $360 is appropriate.

## CONCLUSIONS OF LAW

1. The Commission has jurisdiction of the parties and of the subject matter of this proceeding.

2. On April 29, 1981, the respondent was in serious vioaltion of 29 CFR 1926 §§451(a)(4) and 451(c)(12).

## ORDER

It is ORDERED that:

1. Item 1a of citation 1, for serious violation of 29 CFR 1926.451(a)(4), is AFFIRMED.

2. Item 1b of citation 1, for serious violation of 29 CFR 1926.451(c)(12), is AFFIRMED.

3. An aggregate penalty of $360 is ASSESSED.

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>SHAWNEE CONSTRUCTION, INCORPORATED,<br><br>Respondent. | OSHRC DOCKET NO. 80-0888 |

APPEARANCES:

Jerry R. Atencio, Esq., of Denver, Colorado for Complainant,

Alan A. Armour, Esq., of Denver, Colorado for Respondent.

DECISION AND ORDER

Quentin P. McColgin, Administrative Law Judge: This is a proceeding under Section 10 of the Occupational Safety and Health Act of 1970 (the Act), 29 U.S.C. §659(c), involving alleged violations of §5(a) of the Act, 29 U.S.C. §654(a)(2).[1/]

This matter arose out of an inspection of respondent's worksite that took place on January 17, 1980 in Colorado Springs, Colorado. As a result of that inspection, respondent was issued two citations. The first, Citation No. 1, charges respondent with three serious violations of the trenching and excavation standards for which a single penalty of $360.00 is proposed. The other citation, Citation No. 2, alleges a single non-serious violation for which no penalty was proposed.

1/ "Each employer- shall comply with occupational safety and health standards promulgated under this chapter."

The citations were duly contested. Thereafter, a complaint and answer were filed. Except for admitting that respondent is a corporation, that two citations were issued to it and that respondent filed a notice of contest, respondent denies virtually all the remaining allegations of the complaint. Additionally, respondent's answer contains a number of express denials including denials that it is engaged in a business affecting commerce and that it is an employer within the meaning of the Act. Additionally, respondent alleges that it contested all the citations that were issued to it and did not limit its notice of contest to Citation No. 1 as is alleged in the complaint. Respondent's answer does not raise any affirmative defenses; however, such answer was amended at the conclusion of the hearing to raise the affirmative defense of impossibility. (Tr. 129)[2/]

A hearing was held in this matter on June 23, 1980 at Denver, Colorado. No appearance was entered on behalf of the affected employees or any of them. During the course of the hearing, complainant announced that he would not pursue the violation alleged in Citation No. 2. Thus, Citation No. 2 is deemed to have been withdrawn.

At the conclusion of the evidence, both parties waived closing argument and indicated that they would file briefs. Respondent filed Proposed Findings of Fact and a Brief in support thereof: complainant did not. Having heard and observed the witnesses and having fully considered all the evidence as well as the pleadings, the arguments of counsel and respondent's post-hearing submissions, the undersigned hereby makes the findings, conclusions and order set forth below. To the extent

---

2/ The following abbreviations shall be used in this decision:

| | | |
|---|---|---|
| Tr. | - | Transcript |
| C- | - | Complainant's Exhibit |
| RB | - | Respondent's Brief |

that proposed findings of fact have not been adopted in this decision, they are rejected as being either inaccurate or unnecessary to the disposition of this case. To the extent that there are any pending motions which have not been expressly granted herein, they are denied.

## Findings Of Fact

1. Respondent is a corporation which is headquartered in Kansas City, Kansas. (Tr. 76) It has an office in Monument, Colorado (Tr. 78), and does business in the states of Kansas and Colorado. (Tr. 76)

2. On January 17, 1980, respondent was engaged in the installation of a sewer line at the intersection of Circle Drive and LeLaray Street in Colorado Springs, Colorado. (Tr. 7) Six employees of respondent were engaged in such project including David C. Davis, respondent's foreman who was in charge of that project. (Tr. 8, 58 & 89)

3. In order to protect its employees, respondent was using a trench box in connection with the installation of the sewer line. (Tr. 93) However, due to the presence of an intersecting gas line, it was impossible to use the trench box to install the last two sections of pipe which are depicted in C-2. (Tr. 20, 93)

4. The gas line which intersected the sewer pipe was approximately ten feet from the end of the sewer pipe. (Tr. 57) Such line was located from three to four feet below ground level. (Tr. 53)

5. Respondent had been installing sewer pipe which was sixty inches in diameter measured from the interior. (Tr. 125) The thickness of the sewer pipe walls was six inches. (Tr. 125) However, the diameter of the pipe had changed and the diameter of the pipe depicted in C-2 was fifty-four inches. (Tr. 126)

6. To install the sewer pipe, respondent employed the construction technique of excavating the trench with a backhoe (Tr. 92) and then lowering the pipe

sections into the trench by means of a cable attached to the backhoe which cable was wrapped around the pipe section. (Tr. 93) The cable had a slip hook on the end which would be released by an individual after its placement. (Tr. 94)

7. The aforesaid construction technique contemplated the employment of a person inside the pipe who, aided with a laser beam, was responsible for getting the pipe sections in line and grade. (Tr. 103) The duties of the employee inside the pipe did not require him to be exposed to the open trench. (Tr. 45) He exited from the other end of the trench. (Tr. 45)

8. While approaching the trench and before initiating the opening conference, compliance officer Nellor observed three of respondent's employees in the trench. (Tr. 9, 12, 14, 16, 17 & 45) Two of them were standing on the pipe depicted in C-2. (Tr. 9, 14-17) The third, was standing on the ground outside the end of the pipe depicted in C-2. (Tr. 12, 14, C-1)

9. The trench was eleven feet deep and approximately twelve feet wide and seventeen feet long. (Tr. 9)

10. The walls of the trench including the wall which constituted the end of the trench depicted in C-2 were not sloped but were, instead, vertical. (Tr. 20, 22 & C-2)

11. The distance from the section of pipe depicted in C-2 to the vertical wall which comprised the trench end was from twelve inches to eighteen inches. (Tr. 102)

12. Next to the trench was a spoil pile which was approximately one foot from the edge of the trench. (Tr. 10-11, 13, 26 & C-1)

13. The soil in the immediate area of the trench end depicted in C-2 was virgin soil. (Tr. 124-125) The lower eight feet of the eleven foot deep trench consisted of hard shale. (Tr. 104, 123) Above the shale was two feet of hard compacted clay (Tr. 104) above which was roadbase topped with asphalt. (Tr. 104, 110)

14. The only means of providing support for the trench walls other than by the use of a trench box was by the use of trench jacks. (Tr. 115) However, trench jacks could not be used when the pipe was in the trench. (Tr. 115-116)

15. During the inspection, the walls of the trench were subjected to vibrations from the idling backhoe which was situated next to the trench, a heavy vibration compactor that was working nearby, a hand-operated power tamper that was also working nearby and automobile traffic emanating from the road that was adjacent to the end of the trench. (Tr. 25, 27, 119-121; C-1, 2 & 3)

16. The hazard presented by the location of the spoil pile within two feet of the trench edge, the absence of sloping of the sides of the trench and the absence of additional precautions having been taken by way of shoring the walls of the trench is a cave-in. (Tr. 48).

17. The two employees who were on top of the sewer pipes were not exposed to danger by reason of respondent's failure to comply with the standards set forth in Citation No. 1. (Tr. 45)

18. The employee who was observed standing outside the end of the sewer pipe depicted in C-2 was exposed to the hazard of a cave-in of the walls of the trench. (Tr. 43)

## Conclusions of Law

1. Respondent, at all times material hereto, was engaged in a business affecting commerce within the meaning of §3(5) of the Act, 29 U.S.C. §625(5).

2. Respondent is subject to the requirements of the Act and the standards promulgated thereunder.

3. The Commission has jurisdiction of the parties and the subject matter of this proceeding.

4. Respondent violated 29 C.F.R. §1926.652(c) in that it failed to appropriately slope or otherwise provide appropriate protection for the sides of its trench.

5. Respondent violated 29 C.F.R. §1926.652(e) in that it failed to provide additional protection by way of shoring or bracing for the sides of its trench which was subjected to vibrations emanating from the operations of machinery and from highway traffic.

6. Respondent violated 29 C.F.R. §1926.651(i)(1) in that it failed to set back at least two feet from the edge of its trench, the spoil pile which was adjacent to one of the trench sides.

7. The aforesaid violations were non-serious in nature.

8. Taking into consideration the short duration of exposure to the conditions present in respondent's trench, the limited number of respondent's employees who were exposed to such hazard as well as respondent's manifest good faith effort to provide a safe working place for its employees, it would be inappropriate to assess a penalty for the aforesaid non-serious violations.

## Discussion

Respondent vigorously contends that the Commission is without subject matter jurisdiction in this case. The substantive argument advanced in support of this contention is that the evidence does not establish that respondent is engaged in a business affecting commerce. (RB at 6)

The evidence establishes that respondent's corporate office was in Kansas City, Kansas, (Tr. 76) that it "...had a job going in Colorado and also in Kansas" (Tr. 77) and that it had an office in Monument, Colorado. (Tr. 79) It is clear from the foregoing that respondent conducts business in more than one state. This alone is sufficient to establish that it is engaged in business affecting commerce and is subject to the jurisdiction of the Act. Shorecrest Concrete Contractors, 75 OSAHRC ___, 3 BNA OSHC 1739, 1975-76 CCH OSHD ¶20,166 (No. 3249, 1979).

In its brief, respondent takes vigorous exception to the ruling by the undersigned which permitted complainant to reopen his case-in-chief and present the evidence upon which the finding of commerce is based. As respondent correctly points out in its brief, there was no evidence offered during the case-in-chief upon which a finding of commerce could be based. Immediately after complainant rested, complainant's counsel was asked to be prepared to address the issue of commerce when the hearing resumed. Immediately thereafter, respondent formally moved to dismiss for failure to prove commerce. After the ensuing recess, complainant moved to reopen the case-in-chief to present additional evidence going to the issue of commerce. This request was granted notwithstanding respondent's strenuous objection. The stated basis for granting the request was that respondent had not shown any prejudice that would result to it by permitting the reopening of the case-in-chief.

Respondent argues that permitting complainant to reopen his case-in-chief was improper and constituted error. (RB at 4) To the extent that there is a rationale for respondent's stated position, such rationale appears to be on page 3 of its brief. There it is stated:

> "...although there may be some additional latitude permitted in a hearing before an administrative law judge in cases of this nature, we submit it is not for the Court to become a participant in this proceeding, but is rather for the Court to rule upon objections, motions and on the basis of the evidence presented to make findings of fact and conclusions of law. If a Court intervenes in proceedings to permit a party to cure a defect in its proof or defense, as the case may be, this will most certainly interfere with the adversary process which is contemplated by the Occupational Safety and Health Act, and for that matter, all other litigated matters."

This view of the responsibilities of a Commission judge is essentially the "game theory" of administrative adjudication which was rejected in the single case

respondent cites in support of its position. Brennan v. Occupational Safety and Health Review Commission, 492 F.2d 1027 (2d Cir. 1974). Indeed, respondent's view conflicts with the role of a judge envisioned by Commission Rule 26, 29 C.F.R. §2200.66, which provides in pertinent part:

> "It shall be the duty of the Judge to conduct a fair and impartial hearing, to assure that the facts are fully elicited, to adjudicate all the issues and avoid delay..." (Emphasis added)

Thus, the undersigned's action in suggesting and permitting the reopening of the case-in-chief appears to be fully consistent with the responsibilities of a Commission judge; hence, such action was proper. Since the evidence elicited during the reopened case-in-chief established that respondent was engaged in a business affecting commerce, respondent's pending motion to dismiss which was taken under advisement is hereby denied.

Turning now to the substantive allegations, respondent is charged with having violated three of the trenching and excavation standards.[3/] The first charge, Citation No. 1, Item No. 1a, alleges that respondent violated 29 C.F.R. §1926.652(c) which standard provides:

> Sides of trenches in hard or compact soil, including embankments, shall be shored or otherwise supported when the trench is more than five feet in depth and eight feet or more in length. In lieu of shoring the sides of the trench above the 5-foot level may be sloped to preclude collapse, but shall not be steeper than a 1-foot rise to each 1/2 foot horizontal...

To establish a prima facie showing of noncompliance with this standard, the Secretary must show that the trench at issue is at least five foot deep and at least five foot long, that the trench is neither shored or sloped appropriately, and a significant portion of the trench wall is composed of hard or compact soil. A respondent

---

3/ The specific allegations, as set forth in Citation No. 1, Items 1a-1c are appended hereto as Appendix A.

may then rebut this prima facie showing by proving that its trench was dug entirely in solid rock, shale, or cemented sand or gravel, which are not required to be shored or sloped. CCI, Inc., 80 OSAHRC 127/D4, 9 BNA OSHC 1169, 1981 CCH OSHD ¶25,091 (No. 76-1228, 1980), appeal filed No. 81-1218 (10th Cir. February 25, 1981).

Here, it is undisputed that the trench was at least five foot deep and at least eight feet long and that it was neither shored or appropriately sloped. Furthermore, the testimony of respondent's foreman establishes that two feet of the trench wall is composed of hard compacted clay topsoil. (Tr. 104) Thus, complainant has established a prima facie case of noncompliance with the cited standard.

Respondent, nevertheless, argues that the materials comprising the trench walls are of solid bedrock and are not required to be shored or sloped. This argument is essentially an argument that the cited standard is inapplicable. This argument relies upon the implicit exemption from the sloping or shoring requirements of 29 C.F.R. §1926.652(c) contemplated under Table P-1 which exemption is recognized by the Commission in its decision in CCI, Inc., supra. This table which is set forth below 29 C.F.R. §1926.652(g) permits a 90° sloping of the sides of excavations when such sides are comprised of "solid rock, shale or cemented sand or gravel."

Here, only eight of the eleven foot deep trench was comprised of the enumerated categories of materials exempted from the sloping requirements. The other three feet were comprised of a two foot layer of hard compacted clay and the remaining one foot was comprised of an unspecified portion of roadbed topped by asphalt.

Thus, the materials comprising the trench walls were heterogenous. As such, the determination of the applicable standard is controlled by the principle that a trench consisting of soils of differing strengths is only as stable as its weakest component. CCI, Inc., supra. Here, a significant portion of the trench walls was

comprised of soils which are hard or compact. Since these materials are obviously less stable than solid rock or shale, the cited standard, 29 C.F.R. §1926.652(c), applies.

The argument could be made that the cited standard is inapplicable because here, the less stable soil which was less than three foot in depth rests upon what is, in essence, a ledge of solid rock or shale. There is a certain logic in this argument in that it would seem less likely that a cave-in would occur under these circumstances than if the layer of less stable material were lower in the trench walls. Nevertheless, the Commission's holding in W.N. Couch Construction Co., 76 OSHARC 44/A2, 4 BNA OSHC 1054, 1975-76 CCH OSHD ¶20,574 (No. 7370, 1976) makes clear that even if the layer of less stable soil comprising a trench wall is located on top of other materials which are, by themselves, exempted from the sloping requirements, the prescribed protective measures are, nevertheless, required so long as the layer of less stable materials is not insignificant.[4/] In this case, the two foot layer of compacted clay topsoil coupled with the layer of roadbed which was less than one foot in depth cannot be said to be so shallow as to be insignificant. Thus, under the authority of W.N. Couch, supra., the undersigned is constrained to find that the cited standard is applicable.

The undisputed evidence establishes that the respondent failed to comply with 29 C.F.R. §1926.652(e) as alleged in the second charge (Item No. 1b). This standard provides:

> Additional precautions by way of shoring and bracing shall be taken to prevent sides or cave-ins when excavations or trenches are made in locations...where excavations are subjected to vibrations from railroad or highway traffic, the operation of machinery, or any other source.

---

4/ In that case, there was a 4-1/2 foot layer of soft or unstable soil in an eleven foot deep trench which layer was located within 5 feet of ground level.

Thus, it is found that the cited standard is applicable to respondent's operation and that respondent failed to comply with such standard.

Likewise, the evidence establishes respondent's failure to comply with 29 C.F.R. $1926.651(i)(1) as alleged in the third charge (Item No. 1c). This standard provides:

> In excavations which employees may be required to enter, excavated or other materials shall be effectively stored and retained at least 2 feet or more from the edge of the excavation.

The evidence pertaining to the location of the spoil pile is primarily the testimony of the compliance officer. He testified that during his inspection, he observed the spoil pile "approximately a foot" from the edge of the trench. (Tr. 26) He further testified that respondent's foreman "agreed that the spoil pile was too close." Respondent's own foreman, did not refute this testimony. While testifying that they "had been keeping a 24-inch recess...from the edge of the trench to the spoil..." He conceded "we perhaps might have got some closer than that." (Tr. 106)

This evidence is sufficient to establish respondent's failure to comply with the cited standard.

Respondent's non-compliance with all three of the cited standards having been established, the next issue is whether respondent's employees were exposed to the hazard created by such non-compliance. Respondent argues that none of its employees were exposed to the hazard - a cave-in - despite the evidence that three of respondent's employees were observed in the trench during the January 17, 1980 inspection.

In support of this argument, respondent relies upon the concession made by the compliance officer during his testimony that two of the employees who were working on top of the sewage pipe depicted in C-2 were not exposed to any danger. As to the other employee who was working inside the pipe, respondent first argues that he was not outside the pipe. Secondly, respondent relies upon the testimony

of the compliance officer that while in the pipe, this employee was not exposed to any danger.

In view of these concessions by the compliance officer, it is found that the two employees observed on top of the pipe were not exposed to the hazard of a cave-in. It is further found that to the extent that the employee was inside the pipe, he was not exposed to the hazard the standards were designed to prevent. Nevertheless, it is found that this third employee was outside the pipe, albeit briefly; hence, he was exposed to the hazard the standards were designed to prevent.

Respondent argues that there is a conflict in the evidence concerning whether the employee was outside or inside the pipe. This conflict, respondent argues, should be resolved in its favor. However, the evidence is not interpreted as conflicting on this issue.

To the extent that the evidence can be construed as conflicting on this issue, such conflict arises out of the following testimony by compliance officer Nellor and respondent's foreman, Mr. Davis:

> Mr. Nellor: A. ...I observed three employees; two of them were working on top of the pipe section in the trench, one was standing outside the pipe section who was supposed to be in the pipe section, he was outside when I arrived. (Tr. 9)
>
> Mr. Davis: A. When I walked over and was talking with Mr. Nellor, there was an employee that reached out of the pipe and looked up at us like that, and ducked back inside. (Tr. 102-103)

The above-quoted testimony can be construed as conflicting only if it is assumed that the two witnesses observed the same event. However, despite the fact that both witnesses may have observed the same employee duck back into the pipe section (Tr. 16-17, 45), it does not app ar that they witnessed the same event. To the contrary, the record shows that these were sequential events.

The compliance officer testified that his observation of the employees standing outside the pipe section was made "when [he] arrived." It appears that this observation was made before he met with respondent's foreman and identified himself. (Tr. 16, 45) Conversely, the observation reported by respondent's foreman took place while respondent's foreman "was talking to Mr. Nellor." Thus, it is found that respondent's employee was observed standing on the bottom of the trench between the pipe section depicted in C-2 and the vertical wall which constituted the end of the trench. It is further found that at this location, respondent's employees were exposed to the hazard which each of the three cited standards were designed to prevent.

The final consideration in determining whether prima facie cases of violations have been established is whether respondent had actual or constructive knowledge of the violative conditions. Through its foreman who supervised the construction of the trench, respondent was clearly aware that the trench did not comply with the cited standards. Similarly, it was also aware that its employee who worked inside the pipe section had access to the hazardous area, namely, the 12 to 18 inches of open space between the end of the pipe and the vertical wall which constituted the end of the trench. Merely by stepping out of the pipe onto the bottom of the trench, respondent's employee would be exposed to the hazard of a cave-in. Thus, prima facie cases of violations of the cited standards has been established.

Respondent suggests in its brief the possibility of the affirmative defense of impossibility of performance. (RB at 9) However, the facts relied upon in support of this defense apply to only the first of the three charges involved here. Therefore, the violation of the standards specified in the second and third charges are found to have been established.

To establish the affirmative defense of impossibility of performance it must be proven that (1) compliance with the requirements of the cited standards would

preclude performance of the required work and (2) alternative means of employee protection were unavailable. N.J. Lee Construction Co., 79 OSAHRC 12/A2, 7 BNA OSHC 1140, 1979 CCH OSHD ¶23,330 (No. 15094, 1979).

The evidence supports the finding that respondent could not have sloped one side of the trench due to the necessity to maintain traffic on the road which abutted that side of the trench. Nevertheless, respondent has failed to prove that alternative means of employee protection were unavailable. Respondent concedes in its brief that it could have sloped one of the sides of the trench. (Tr. 9) Such concession is fatal to establishing the asserted defense. It is not enough to show that the alternative means of protection which would have provided the full measure of protection contemplated by the standard was unavailable, it must also be shown that the alternatives which would have provided some measure of protection were either unavailable or were taken. Hurlock Roofing Co., 79 OSAHRC 93/A2, 7 BNA OSHC 1867, 1979 CCH OSHD ¶24,006 (No. 14907, 1979).

By sloping just one side of the trench, respondent would have taken a measure contemplated by the standard which would have prevented that side of the trench from caving in. While that would not have provided the full measure of protection contemplated by the standard it would, nevertheless, provide a significant measure of protection. Thus, respondent has failed to establish the asserted defense of impossibility of performance and respondent is found to have violated 29 C.F.R. §1926.652(c) as charged.

The next issue to be considered is whether the violations established by this record are properly classified as serious. By statute, violations are deemed serious "...if there is a substantial probability that death or serious physical harm could result..." Section 17(k) of the Act, 29 U.S.C. §666(j). Here, the relevant consideration is the probable result of an accident not whether an accident is probable.

Niagara Mohawk Power Corp., 79 OSAHRC 36/A2, 7 BNA OSHC 1447, 1979 CCH OSHD ¶23,670 (No. 76-2414, 1979). Thus, in determining whether the violations involved are serious, the focus is upon the predicted severity of the injury should an accident occur as a result of such violations.

In this case, there is insufficient evidence to establish that death or serious physical harm is likely to occur in the event of an accident attributable to the violations of the cited standards. Indeed, the particular facts and circumstances of this case strongly support the conclusion that if there was a cave-in of the sides of the trench the resulting injuries sustained would be minor rather than major.

Here the hazardous area is limited to the end of the trench depicted in C-2 where the third employee was exposed to the hazardous conditions. This employee is surrounded on three sides by vertical walls that are not sloped or shored and no additional protection was provided. On the remaining side of this employee is the sewer pipe which has an outer diameter of 66 inches. The distance between the end of the sewer pipe and the vertical wall which comprises the end of the trench is from twelve inches to eighteen inches.

If either side of the trench were to cave in, the width of the materials which could be expected to fall beyond the end pipe section would not exceed the distance between the end of the pipe and the end of the trench i.e., from twelve inches to eighteen inches. Further, the depth of the materials which could be expected to cave-in would be limited to the three foot layer of materials immediately below ground level which are not solid rock or clay. Given these circumstances, it is difficult to conceive that in the event of a cave-in such a limited amount of materials could cause the employee located at the bottom and middle of the trench serious physical harm.

It could be argued that the major hazard presented by the conditions described above is the possibility of a cave-in of the vertical wall which constitutes the trench end. Nevertheless, the failure to slope, shore or otherwise protect against the hazard presented by such vertical wall is not found to constitute a violation of any of the cited standards for the reason that the theory of the case, as presented and defended, did not encompass any such hazard.

In view of the foregoing, each of the three violations are found to be non-serious in nature. It is further found that it would be inappropriate to assess a penalty for such violations.

ORDER

Based upon the foregoing, it is HEREBY ORDERED that:

1. Citation No. 1, Item Nos. 1a, b & c are AFFIRMED, as non-serious violations, and no penalty is assessed.

2. Citation No. 2, Item No. 1 is VACATED.

Quentin P. McColgin
Judge, OSHRC

Dated: December 30, 1981

## APPENDIX A

1a
29 CFR 1926.652(c): The side(s) of the trench(es) in hard or compact soil, including embankment(s), were not shored or otherwise supported when the trench was more than 5 feet in depth and more than 8 feet in length:

> The trench located at the Corner of Circle Drive and LeLaray Street, Colorado Springs, Colorado, which was crossing Circle Drive to the east.

1b
29 CFR 1926.652(e): Additional precautions by way of shoring or bracing were not taken to prevent slides or cave-ins where trench(es) were made adjacent to back-filled excavations, or where excavations were subjected to vibrations from railroads or highway traffic, operation of machinery, or any other source(s):

> The trench located at the Corner of Circle Drive and LeLaray Street which has 2 lanes of traffic traveling north and south creating a source of vibration.

1c
29 CFR 1926.651(i)(1): Excavated or other material was not effectively stored or retained at least 2 feet or more from the edge of the excavation(s) which employee(s) were required to enter:

> The trench located at the corner of Circle Drive and LeLaray Street which had excavated material stored on the north side and at the edge.

NOTICE OF DECISION

SECRETARY v. FEDERAL CLEARING DIE CASTING COMPANY.

OSHRC DOCKET NO. 80-2903

1. Enclosed herewith is my decision in the above-entitled case. It is being filed on this date and will become the final order of the Commission pursuant to 29 U.S.C. §661(j) on January 4, 1982 unless a Member of the Commission directs that it be reviewed.

2. Parties will not receive any further communication from the Commission on this case unless review is directed by a Member of the Commission. In that case each party will be notified and given an opportunity to submit a brief to the Commission Members prior to their final disposition of the case.

Ralph B. Maxwell
Judge, OSHRC

Enclosure

Date: January 4, 1982

| Respondent. | : | |

ORDER OF DISMISSAL

The warrant upon which the inspection in this case is based was challenged by respondent. On July 29, 1981, the U. S. Court of Appeals for the Seventh Circuit ruled the inspection warrant was invalid, having been issued without probable cause. The complainant's petition for rehearing was denied December 3, 1981.

On December 9, 1981, respondent filed motions for suppression of all evidence obtained pursuant to the warrant, and for dismissal of these proceedings.

No response to these motions has been filed.

Now, therefore, for good cause shown, the motions of the respondent are granted, and it is

ORDERED, that all evidence obtained through the inspection warrant herein be suppressed.

FURTHER ORDERED, that these proceedings be, and the same are hereby in all things dismissed.

Ralph B. Maxwell
Judge, OSHRC

Dated: January 4, 1982

# NOTICE OF DECISION

Secretary v. Capital City Excavating Company, Inc.

OSHRC Docket No. 81-1423

1. Enclosed is a copy of my decision. It will be filed with the Commission on January 6, 1982, and will become the final order of the Commission on February 5, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N. W., Suite 601
   Washington, D. C. 20006

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is February 5, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

CECIL L. CUTLER, JR.
Judge

APPEARANCES:

Sandra B. Kramer, Esquire, U. S. Department of Labor, Cleveland, Ohio, on behalf of the complainant.

Steven D. Rowe, Esquire, Kemp, Schaeffer & Rowe, Columbus, Ohio, on behalf of the respondent.

## DECISION AND ORDER

Following an inspection of its work site in Zanesville, Ohio, on May 5, 1981, Capital City Excavating Company, Inc., (hereinafter Capital City) was issued a willful citation pursuant to Section 9(a) of the Occupational Safety and Health Act of 1970 (29 U.S.C. 651, et seq., hereinafter the "Act"). The Secretary proposes a $5,600 penalty for the alleged violation.

A hearing was held in this cause on October 15, 1981, in Columbus, Ohio. No affected employee or authorized employee representative elected to participate as a party.

There is no issue as to jurisdiction in that respondent, in its answer and at the hearing, conceded it was an employer engaged in a business affecting commerce within the meaning of the Act.

Initially, Capital City was issued a citation alleging a failure to comply with the provisions of 29 C.F.R. § 1926.652(a)[1/] as follows:

> "Soil bank(s) which were more than 5 feet high, and where employee(s) may be exposed to moving ground or cave-ins, were not shored, laid back to a stable slope, or protected by some other equivalent means:
>
> a) Two men were working in a trench that was not adequately sloped or otherwise protected from a cave-in at the Garden Road area of the Falls Township sewer project."

In his complaint, the Secretary moved to amend the citation to allege the correct legal name of respondent to "Capital City Excavating Company, Inc." It was shown as "Capital City Excavating and Company." No objection was lodged at the hearing at this clerical amendment. The motion, accordingly, is granted.

Respondent, however, did object to a motion to amend the complaint to allege a violation of 29 C.F.R. § 1926.652(b)[2/] as follows:

> "Sides of trenches in unstable or soft material, 5 feet or more in depth, were not shored, sheeted, braced, sloped or otherwise supported by means of sufficient strength to protect the employees working within them.
>
> a) Two men were working in a trench that was not adequately sloped or otherwise protected from a cave-in at the Garden Road area of the Falls Township sewer project."

---

[1/] This provision states:

Banks more than 5 feet high shall be shored, laid back to a stable slope, or some other equivalent means of protection shall be provided where employees may be exposed to moving ground or cave-ins. Refer to Table P-1 as a guide in sloping of banks. Trenches less than 5 feet in depth shall also be effectively protected when examination of the ground indicates hazardous ground movement may be expected.

[2/] This states:

Sides of trenches in unstable or soft material, 5 feet or more in depth, shall be shored, sheeted, braced sloped, or otherwise supported by means of sufficient strength to protect the employees working within them. See Tables P-1, P-2 (following paragraph (g) of this section).

The Commission has consistently approved the granting of a prehearing amendment where there is no showing by the party objecting to the amendment that it would be prejudiced in the preparation or presentation of the case. Miller Brewing Company, 80 OSAHRC 5/A2, 7 BNA 2155, 1980 CCH OSHD ¶ 24,168 (No. 78-3216, Jan. 22, 1980). Further, amendments well before the hearing rarely result in any prejudice. Miller, supra.

In this case, the complaint was served on respondent on July 10, 1981, and the hearing was held over three months later.

Respondent, however, argues that, because over two months elapsed between the inspection date and the date the complaint was issued, it was unable to obtain evidence to rebut the amended citation. Since the amendment changes the type of soil involved, respondent alleges it was unable, because of the passage of time and changed conditions, to obtain soil samples for analysis. Respondent further alleges that respondent was not advised specifically by the compliance officer at the time of the inspection that a citation would be issued.

According to Ray Mendenhall, the compliance officer, respondent's representative, Larry Miranda, was advised at the closing conference on the day of the inspection a hazardous condition existed and that a citation "may or may not" be issued for the alleged trenching violation (Tr. 28).

It is obvious that respondent was alerted after the inspection that a citation could be forthcoming and that it would involve a trenching standard. This necessarily involves consideration of the type of soil. At that time, respondent could have obtained samples.

Considering all the facts, I find no prejudice. Respondent's objections to the Motion to Amend are not well founded and the ruling made at the hearing granting the motion was correct.

I.

According to the evidence of record, on May 5, 1981, Capitol City was engaged in installing a sanitary sewer line at Gordon Road in Zanesville, Ohio, known as the Falls Township project. On that date, Ray Mendenhall, a compliance officer of the Secretary, testified that he conducted an inspection of the work site and observed two of respondent's employees emerging from the trench involved in the citation. The trench was approximately 10 feet deep and 11 feet wide at the widest point. The bottom width was estimated at seven feet at its widest point. He used a tape measure for the depth and top dimensions but did not get into the trench to measure its bottom width (Tr. 14-16). He picked up some of the dirt from the trench and determined that "it didn't have a very good cohesion" and "was mostly sandy, silty type soil" (Tr. 16).

The compliance officer noted that there was a backhoe parked at the end of the trench which had been working at one end. In addition, there was a front-end or pay-loader taking dirt out of the trench and loading it into a dump truck. According to Mr. Mendenhall, the operation of these vehicles could cause vibrations around the edge of the trench and increase the hazard of cave-in. He observed water seeping along the bottom and side at the upper end of the trench where digging was being performed. This water was running into the trench and into the pipe being laid. According to Mr. Mendenhall, the presence of water causes a

hydrostatic pressure on the sides of a trench and could cause it to cave-in more readily than normal (Tr. 17).

From his measurements, Mr. Mendenhall found the angle of the trench was 79 degrees. Using Table P-1 of the Standard, the appropriate angle for the trench should have been 1 to 1 or a 45 degree angle (Tr. 19). He conceded that it would have been virtually impossible to slope the trench because of the roadway. However, the respondent could have put in shoring or a trench box (Tr. 18-19).

Mr. Mendenhall took four photographs depicting the trench which were admitted into evidence (Tr. 20, Exs. C-1-C-4). Exhibit C-1, he noted, showed a utility line across the trench which indicated a previous disturbance or excavation of the soil. Exhibit C-2, he stated, showed material alongside the trench sluffing in under tree roots (Tr. 21-22).

Referring to Exhibit C-3, Mr. Mendenhall noted a compression crack along the side which indicated some instability (Tr. 22). Exhibit C-4 showed how dirt had caved and fallen into the trench due to the loading operation (Tr. 23).

Upon cross-examination, Mr. Mendenhall testified he did not see any employee near the portion of the trench depicted in Exhibit C-3 and the employees were working near the widest point of the trench (Tr. 32-33). He admitted he saw no shearing or cave-in of the banks nor did he feel any vibrations from the backhoe (Tr. 50-51). He did not know when the utility line was laid or if the soil had been mechanically compacted at that time (Tr. 51).

Marshall Flynn, an official of the union representing Capital City employees, testified he visited respondent's work site the day preceding the inspection. He

observed a unshored trench which he deemed to be unsafe and brought this to the attention of Larry Miranda, the on-site Capital City superintendant (Tr. 67, 71, 74). This trench was not the same trench which the compliance officer inspected the following day (Tr. 82-83).

Larry Miranda, testifying for respondent, stated he was Capital City's foreman for one of the two sewer crews at the site of the inspection. According to Mr. Miranda, his men were working at the pipe end of the trench and not near the portion of the trench where the tree roots protruded and where backfilling was being performed. They exited also from the trench at the pipe end. The top three-quarters of the trench was composed of clay material. Underneath was sandy matter with a little water in it.

As for the measurements of the trench, he testified the trench was 10 feet deep and approximately 11-1/2 feet wide. The bottom was three feet wide-the width of the hoe bucket (Tr. 89-93). At no time was it seven feet wide at the bottom (Tr. 96). His job report for the day noted measurements as "Ditch 10 feet deep and 12 feet wide" (Tr. 95, Exh. R-3).

Concerning the safety of the trench, Mr. Miranda stated he used his own judgment. He also talked with his men in the trench and they did not object to working in it. He has not had any employees injured on this project nor had any caving or shearing of the side walls of the trench occurred (Tr. 93, 97, 99).

Steve McClure, a laborer for Capital City, was laying pipe in the trench at the time of the inspection. In his words, "basically, it [the trench] was pretty good." Water and sand were running down the sides, but there was nothing to be

afraid of and he felt safe. It only took two to three minutes to spread gravel and lay a section of pipe in and the ladder was no more than five feet away (Tr. 105-106). According to Mr. McClure, the trench was 38 to 40 inches wide at the bottom (Tr. 107).

Using the engineering plans for the Falls Township sewer project, James R. Lang, respondent's vice-president, testified that at the spot of the inspection, the elevation had been changed from 7.6 feet to 9.6 feet (Tr. 113, Exs. R-4, R-5).

II.

Section 29 C.F.R. § 1926.652(b), mandates that "sides of trenches in unstable or soft material, 5 feet or more in depth, shall be shored, sheeted, braced, sloped or otherwise supported by means of sufficient strength to protect the employees working within them."

Concerning the type of soil at the trench, the evidence is clear that it was soft and unstable. Mr. Mendenhall described it as "mostly sandy, silty type soil which didn't have a very good cohesion" (Tr. 16). Mr. Flynn described the soil in the general area as sandy and very crumbly (Tr. 73, 81). Respondent's foreman described the soil of the lower portion by the trench as sandy with a little moisture in it (Tr. 93). Finally, Mr. McClure, while stating the trench was "pretty good," said "there was water and sand running down off the sides of it" (Tr. 105).

The excavation and trenching standards, including Tables P-1, create a presumption that predominately sandy soils, unless cemented, are by their very nature soft or unstable within the meaning of Section 1926.652(b). Duane Meyer, d/b/a D. T. Construction Company, 79 OSHARC 57/D4, 7 BNA OSHC 1560, 1979 CCH OSHD ¶ 23,742 (Docket No. 16029, 1979).

Besides its sandy quality, other factors contributed to a lack of stability of the soil. Witnesses attested to the presence of water. Equipment was being operated along the sides of the trench (Tr. 17). The soil had previously been disturbed (Tr. 21). Finally, there was a compression crack along one side (Tr. 22).

It is uncontroverted that there was no shoring, sheeting, bracing or other similar method used to support the trench. Thus, the trench would have had to have been sloped in order to comply with the standard. The degree of sloping is dependent upon the type of soil. Table P-1 requires an angle of 45 degrees for average soil. An even greater angle of repose is required for less stable soil-and the evidence is clear that the soil was of this type.

Mr. Mendenhall's measurements, which included some estimates, clearly show the trench was not laid back to the required angle. But even if respondent's figures would be used-that the trench was 10 feet deep, 3 feet wide at the bottom and 11-1/2 feet wide-the angle of repose was clearly not in compliance with the standard even for average soil.

Considering the foregoing, it is quite clear that respondent failed to comply with the cited regulation. The violation was serious since a cave-in could cause serious injury or death to an employee. Mr. Mendenhall testified as to a fatality occurring a mile away from such a cave-in (Tr. 25). Mr. Flynn also described a serious injury from such a mishap (Tr. 76).

The violation is also charged as willful. Complainant avers that respondent was made aware of the danger because Mr. Flynn, the union agent, had warned the company the preceding day. Larry Miranda, the foreman, was familiar with OSHA standards and had been involved in an earlier trenching violation.

I cannot reach the same conclusion as the Secretary. Mr. Flynn did not observe the same trench here cited and he did not speak with Mr. Miranda except to greet him (Tr. 88). According to Mr. Miranda, prior to the time when the compliance officer inspected the trench, the workers were at the pipe end and could exit in that area. There was no reason for them to work at the other end which apparently was less safe due to the tree roots. He used his own judgment and talked with his men and with the backhoe operator and concluded it was safe at the time. Further, he stated he had a sewer box "on the way" which he had called for before the inspection (Tr. 99) and installed it the following day. He has had no injuries or cave-ins. This does not bespeak conduct or belief on the part of Mr. Miranda such as to equate to either an intentional disregard of, or plain indifference to, the Act's requirements. Under the circumstances, I cannot conclude that the violation was willful.

The Secretary has proposed a penalty of $5,600 for the alleged willful violation. However, in view of my finding that the violation was not willful, a substantial reduction in the penalty is necessary.

Respondent is a rather small company employing about 150 employees. While it has had a previous citation for a trenching violation, there is no evidence that any accidents have occurred or employees injured from trench failures. Further, the length of time of exposure of employees was minimal. Considering all facts, I find a penalty of $300 is reasonable and equitable.

I reach the following findings of fact and conclusions of law:

## FINDINGS OF FACT

1. Respondent is a small company which, on May 5, 1981, was engaged in installing a township sewer line in Zanesville, Ohio.

2. On May 5, 1981, a compliance officer for the Secretary inspected the jobsite. Two employees had been working in a trench which was approximately 10 feet deep and 11 feet wide. The bottom width was estimated by the compliance officer to be seven feet. Respondent's evidence was to the effect that it was three feet wide at the bottom.

3. The soil of the trench was sandy and silty in nature without good cohesion and had moisture such as to render the soil soft and unstable.

4. The trench was not shored, sheeted, braced or otherwise supported, and it was not laid back to a safe angle of repose as required by the cited standard and Table P-1 thereof.

5. Employees working in the trench were subjected to the hazard of cave-in or collapse of the trench which could lead to death or serious injury. There was, however, minimal length of time of exposure by employees.

6. The union agent on the preceding date visited the jobsite and observed a trench which he considered unsafe and which he brought to the attention of Capital City representatives. This was not the same trench as here cited.

7. Respondent's foreman normally did have a trench box on the jobsite and, on this occasion, had ordered one to be delivered.

8. Respondent did not exhibit either an intentional disregard of, or plain indifference to, the Act's requirements as to equate to willfulness.

## CONCLUSIONS OF LAW

1. Respondent is engaged in a business affecting commerce within the meaning of the Act and this Commission has jurisdiction over the subject matter and parties to this action.

2. Respondent was in violation of Section 5(a)(2) of the Act by failing to comply with the provisions of 29 C.F.R. § 1926.652(b).

3. The violation was serious.

4. The violation was not willful.

Based upon the foregoing findings of fact and conclusions of law, Citation Number 1 is affirmed, as amended, and a penalty of $300 is assessed therefor.

SO ORDERED.

Dated this 6th day of January, 1982.

# NOTICE OF DECISION

Secretary of Labor v. Don Carter Industrial Coatings

OSHRC Docket No. 81-0493-B

1. Enclosed is a copy of my decision. It will be filed with the Commission on January 11, 1982, and will become the final order of the Commission on February 10, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

Chief Review Counsel
Occupational Safety and Health Review Commission
1825 K Street, N.W., Suite 601
Washington, D.C.. 20006

Any Petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is February 10, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

Appearances:

For the Complainant:
Eloise Velucci, Esq., Dallas, Texas,

For the Respondent:
No appearance at the hearing,
Paul Z. Moses, Cheney, Kansas, on the Notice of Contest.

Child, R. M., Judge, OSHRC:

## Statement of the Case

This proceeding is before the Occupational Safety and Health Review Commission (the Commission), pursuant to Section 10(c) of the Occupational Safety and Health Act of 1970, 29 U.S.C. §651 et seq. (the Act).

By order dated July 31, 1981 Chief Administrative Law Judge Paul A. Tenney dismissed the Notice of Contest filed by the respondent herein to Serious Citation No. 1, issued to the respondent on January 23, 1981, to the extent said notice put in issue the substance of said citation. Judge Tenney's Order reserved for determination the issue of contested penalties only.

Judge Tenney's aforesaid Order became a final Order of the Commission on August 31, 1981.

The matter came on regularly for hearing at Tulsa, Oklahoma before the undersigned judge on the issue of appropriateness of the penalties on October 28, 1981.

No one appeared at said hearing on behalf of the respondent. Complainant appeared at said hearing to seek affirmance and assessment of penalties totaling $1,320.00 for various items set forth in Serious Citation No. 1, aforesaid. Default of the respondent was duly entered. The complainant thereupon presented evidence in support of the penalties proposed in said Serious Citation No. 1.

## The Evidence

Mr. Dan D. Cook, Supervisory Industrial Hygienist for the Tulsa area office of the United States Occupational Safety and Health Administration testified on behalf of the complainant. The inspection, citation and penalties herein were accomplished under his supervision.

With respect to the violations noted at items 1A[1/] and 1B[2/] the likely injury would be some permanent hearing damage or loss. These two items were com-

1B 29 C.F.R. 1910.95(b)(3): Sound levels exceeded the values in table G-16 of subpart G of 29 C.F.R. 1910 and continuing, effective hearing conservation program was not aministered; i.e., for compliance purposes, a minimally effective hearing conservation program consists of the following elements: 1) A baseline audiogram for all employees exposed to noise levels equal to or in excess of the standard; 2) Periodic audiograms for each overexposed employee; 3) Analysis of audiogram results with retesting and/or referral to an otolaryngologist or qualified physician when a significant threshold shift occurs. A significant shift will be considered to be equal to or or greater than 20 dB at any test frequency; 4) Where insert ear plugs are utilized, individual employee fitting shall be conducted by a trained person, and employee fitting shall be conducted by a trained person, and employees shall be instructed in the care and use of the devices:

For employee engaged in sandblasting operation at the Conoco Refinery in Ponca City. Employer's program was deficient in element 1.

COMBINING STATEMENT
Failure to comply with the above standards constitutes an alleged serious violation.

Standard

§1910.95 Occupational noise exposure.

(b)(3) In all cases where the sound levels exceed the values shown herein, a continuing, effective hearing conservation program shall be administered.

of employees exposed (one), the duration of exposure (one half day), the type of protective equipment, if any, being utilized (earplugs), and the lack of an effective hearing conservation program including adequate medical surveilance.

The base penalty was then adjusted by allowing credit to the respondent for size (26 employees), good faith based upon conduct during the inspection and the overall program of the respondent concerning safety and health and finally the respondent's history. As a result of following this procedure a combined penalty of $420.00 was proposed for items 1A and 1B.

With respect to the violations noted at items 2A[3/], 2B[4/] and 2C[5/] of said Serious Citation No. 1 the same employee was involved and all other factors considered were the same with the exception that the protective equipment being utilized

4/ A description of the violation and the standard involved.

Citation

2B 29 C.F.R. 1910.1000(c): Employee(s) were exposed to material(s) in excess of the 8-hour time weighted average limit(s) listed for that material(s) in table Z-3 of subpart Z of 29 C.F.R. part 1910:

For sandblaster who was exposed to a time weighted average concentration of silica dust at a level of 1.35 milligrams per cubic meter. The permissible exposure limit for silica with 20% quartz is .45 milligrams per cubic meter.

Standard

§1910.1000(c) Air contaminants.

(c) Table Z-3: An employee's exposure to any material listed in table Z-3, in any 8-hour work shift of a 40-hour work week, shall not exceed the 8-hour time weighted average limit given for that material in the table.

5/ A description of the violation and the standard involved.

Citation

2C 29 C.F.R. 1910.1000(e): Feasible administrative or engineering controls were not determined and implemented to reduce employee exposure(s):

For sandblaster who was exposed to a time weighted average concentration of silica dust at a level of 1.35 milligrams per cubic meter.

COMBINING STATEMENT
Failure to comply with the above standards constitutes an alleged serious violation.

Standard

§1910.1000(e) Air contaminants.

(e) To achieve compliance with paragraph (a) through (d) of this section, administrative or engineering controls must first be determined and implemented whenever feasible. When such controls are not feasible to achieve full compliance, protective equipment or any other protective measures shall be used to keep the exposure of employees to air contaminants within the limits prescribed in this section. Any equipment and/or technical measures used for this purpose must be approved for each particular use by a competent industrial hygienist or other technically qualified person. Whenever respirators are used, their use shall comply with § 1910.134.

The combined penalty proposed for items 2A, 2B and 2C was $420.00.

With respect to the violation noted at item 3[6/] of said Serious Citation No. 1, the hazard presented was that of severe lacerations, broken bones and possibly death resulting from the whipping action of the nozzle should the operator lose control of it.

It was determined that one employee had exposure to the hazard, sometimes for a full day, but on the day of the inspection for approximately 173 minutes. The operator was considered to be at the point of danger and subjected to some stress in that he was working in very cold temperature conditions and high winds. All other factors considered in arriving at the penalty to be proposed for this violation were as discussed in the preceeding items and caused a penalty of $480.00 to be proposed for item 3.

## Discussion

The penalty proposed by the Secretary of Labor through his area directors is assessed only if not contested; otherwise the Review Commission can affirm the penalty as proposed, modify it or vacate it. Long Manufacturing Co. v. OSHRC, 554 F.2d 903

---

6/ A description of the violation and the standard involved.

### Citation

3 29 C.F.R. 1910.244(b): Abrasive blast cleaning nozzle(s) were not equipped with an operating valve which had to be held open manually:

Sandblasting operation located north of the east plant pumphouse at the Conoco Refinery in Ponca City.

### Standard

§1910.244 Other portable tools and equipment.

(b) For jacks sent out of shop for special work, when sent out and when returned.

(8th Cir. 1977); California Stevedore and Ballast Co. v. OSHRC, 517 F.2d 986 (9th Cir. 1975). The determination of an appropriate penalty is within the discretion of the Review Commission. Western Waterproofing Co. v. Marshall, 576 F.2d 139 (8th Cir. 1978).

In assessing penalties for violations of the Act, the Commission must consider the size of the business of the cited employer, the gravity of the violation, the employers good faith or absence of it and the history, if any, of previous violations. 29 U.S.C. §666(i).

Evidence bearing on said factors was presented by the complainant. Such evidence was sufficient to support the appropriateness of the penalties as proposed.

---

Based upon the foregoing factors and the evidence there are hereby entered the following:

## Findings of Fact

1. The sum of $420.00 is an appropriate penalty for the violations set forth at items 1A and 1B of Serious Citation No. 1, issued to respondent January 23, 1981.

2. The sum of $420.00 is an appropriate penalty for the violations set forth at items 2A, 2B and 2C of said Serious Citation No. 1.

3. The sum of $480.00 is an appropriate penalty for the violation set forth at item 3 of said Serious Citation No. 1.

## Conclusions of Law

1. The Commission has jurisdiction of the parties and of the subject matter herein.

2. Items 1A and 1B of Serious Citation No. 1, issued to respondent January 23, 1981 should be affirmed and a combined penalty of $420.00 assessed.

3. Items 2A, 2B and 2C of said Serious Citation No. 1 should be affirmed and a combined penalty of $420.00 assessed.

4. Item 3 of said Serious Citation No. 1 should be affirmed and a penalty of $480.00 assessed.

ORDER

All items of Serious Citation No. 1, issued to respondent January 23, 1981 are AFFIRMED and a total combined penalty of $1,320.00 is ASSESSED.

|---|---|
| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>FARRELL ROOFING & SHEET METAL CO., INC.,<br><br>Respondent. | OSHRC DOCKET NO. 81-0954-S and 81-1121-S |

DECISION AND ORDER

Appearances: Max A. Wernick, Esq., of Dallas, Texas, for the complainant.

Travis G. Wilson, Esq., and Lynne W. Parsons, Esq., of Houston, Texas, for the respondent.

PROCEDURAL HISTORY

BLYTHE, Judge:

This consolidated proceeding, brought under the simplified procedure rules of the Occupational Safety and Health Review Commission ("the Commission") involves three citations issued to the respondent, Farrell Roofing & Sheet Metal Co., Inc. ("Farrell"), for allegedly violating three safety standards promulgated by the Secretary of Labor ("the Secretary") under §6 of the Occupational Safety and Health Act of 1970, 29 U.S.C. §651-658 ("the Act").

The citation in Docket No. 81-0954S was issued March 30, 1981, after

a general inspection March 23, 1981, of a building construction site at Fairbanks North Houston at Highway 290, Houston, Texas, by two compliance officers of the Occupational Safety and Health Administration ("OSHA") and alleges two serious violations of 29 CFR 1926.500(g)(1) for failure to guard the edges of a low-pitched roof. Farrell gave timely notice of contest April 6, 1981.

The two citations in Docket No. 81-1121S were issued April 3, 1981, after an investigation by an OSHA compliance officer March 19-31, 1981, of a fatality at a building construction site at 11381 Meadowglen Lane, Houston, Texas. Citation 1 alleged a serious violation of 29 CFR 1926.450(a)(9) for use of an extension ladder the side rails of which did not extend 36 inches above the landing. Citation 2 alleged a willful violation of 29 CFR 1926.500(b)(1) for failure to guard a skylight opening in the roof. Farrell timely contested these citations April 13, 1981.

The two cases came on regularly for hearing at Houston, Texas, on October 27, 1981. No affected employee or representative of affected employees took part in this proceeding. Farrell submitted a posthearing brief. The Secretary submitted proposed findings of fact and conclusions of law, but did not submit a posthearing brief.

## THE ISSUES

Farrell conceded jurisdiction and coverage at the hearing (Tr.5-7). The issues remaining to be decided are:

1. Whether Farrell was in serious violation of 29 CFR 1926.500(g)(1).

2. Whether Farrell was in serious violation of 29 CFR 1926.450(a)(9).

3. Whether Farrell was in willful violation of 29 CFR 1926.500(b)(1).

4. The appropriate penalty for any violations found.

## DISCUSSION AND OPINION

The alleged serious violations of §1926.500(g)(1).

Item 1 of citation 1 (Docket No. 81-0954S) alleges two violations of §1926.500(g)(1), [1] as follows:

> Employee(s) were not protected from falling from all unprotected sides and edges of roof during the performance of built up roofing work on low-pitched roofs with a ground to eave height greater than 16 feet (4.9 meters):
>
> (a) employees working on the northeast corner of the roof on top Building #1 for Farrell Roofing Company at Fairbanks North Houston Road and Highway 290, Houston, Texas;

---

[1] The cited standard provides:

> (g) Guarding of low-pitched roof perimeters during the performance of built-up roofing work.
>
> (1) General provisions. During the performance of built-up roofing work on low pitched roofs with a ground to eave height greater than 16 feet (4.9 meters), employees engaged in such work shall be protected from falling from all unprotected sides and edges of the roof as follows:
>
> (i) By the use of a motion-stopping-safety system (MSS system); or
>
> (ii) By the use of a warning line system erected and maintained as provided in paragraph (g)(3) of this section and supplemented for employees working between the warning line and the roof edge by the use of either an MSS system or, where mechanical equipment is not being used or stored, by the use of a safety monitoring system; or
>
> (iii) By the use of a safety monitoring system on roofs fifty feet (15.25 meters) or less in width (see Appendix A), where mechanical equipment is not being used or stored.

(b) employees working on the southwest corner of the roof on top of Building #1 for Farrell Roofing Company at Fairbanks North Houston Road and Highway 290, Houston, Texas.

Item 1(a) must be vacated because of an almost complete lack of evidence. The actual inspection was conducted by Louis Smith, an OSHA compliance officer, who was not produced as a witness although he still is employed by OSHA in its Little Rock, Arkansas, office. He was accompanied to the inspection site by a trainee, Mrs. Yolandia Murphy, but she did not go up on the roof. She stood at the foot of the access ladder at the southwest corner of the building, whereas item 1(a) concerns the northeast corner. According to Charley Wright, Farrell's foreman, no Farrell employees were working at the northeast corner during the inspection (Tr.239). It appears from questions asked of Wright that this item concerns workers who were tacking sheet metal (Tr.242,243), but according to Wright no Farrell employees were so engaged. He said there were non-Farrell employees, including carpenters, on the roof at that time (Tr.242). He also testified that two Farrell crews were working on the roof, but one was at the southwest corner and the other was in the middle of the roof, 30 feet from any edge (Tr.239), and that there was a warning line six feet from the edge on the "backside"--apparently meaning the northeast (Tr.247).

In this state of the record, item 1(a) must be vacated.

Farrell relies on the use of a safety monitoring system as a defense to the item 1(b) charge. Such a system is permitted by §1926.500(g)(1)(iii) and is defined by §1926.502(p)(7) as follows:

> "Safety-monitoring system"--a safety system in which a competent person monitors the safety of all employees in a roofing crew, and warns them when it appears to the monitor that they are unaware of the hazard or are acting in an unsafe

manner. The competent person must be on the same roof as and within visual sighting distance of the employees, and must be close enough to verbally communicate with the employees..

The flaw in Farrell's defense is that the use of a safety monitoring system is limited by §1926.500(g)(1)(iii) to roofs 50 feet or less in width, whereas the roof in question, according to Farrell's own foreman, Wright, was 100 or 150 feet wide (Tr.238,242).

Therefore, it is not necessary to resolve a conflict in the testimony of Wright and Mrs. Murphy regarding a conversation between Wright and Smith which is actually the Secretary's only evidence negating the use of a monitoring system. Mrs. Murphy testified that after Smith completed his inspection he and Wright returned to the ground and she heard Wright admit to Smith that he didn't have anyone watching to make sure that employees didn't get too near the roof's edge (Tr.21). Wright denied that such a conversation took place or that he even returned to the ground with Smith (Tr.233). Actually, a photograph taken by Smith (Exhibit C-1) shows Wright in position to act as a monitor, as he says he did (Tr.228, 231, 244). Mrs. Murphy's testimony is, at best, a poor substitute for the direct evidence Smith could have given, and Wright's seemed to me to be more credible. However, as previously stated, it makes no difference because the roof was too wide for a safety monitoring system.

Four or five Farrell employees were spreading gravel on the roof, 21 or 22 feet off the ground, as the material was brought up by a high-lift forklift, or "lull". In doing so they approached within a foot or two of the edge (Tr.15,16,228,237,238). There was no form of fall protection permitted by the standard. The surface below was littered with debris and machinery, and a fall would probably have resulted in death or serious physical injury (Tr.26,49).

The alleged violations of §§1926.450(a)(9) and 1926.500(b)(1).

The alleged serious violation of §1926.450(a)(9) [2] and alleged willful violation of §1926.500(b)(1) [3] (Docket No. 81-1121S) will be discussed together because Farrell's defense to both citations is the same--that the exposed employees were those of an independent subcontractor who were not supervised in any way by Farrell.

Farrell does not dispute the existence of the violative conditions, and indeed the evidence is conclusive on that score. However, it must be noted at the outset that §1926.500(b)(1), which pertains to floor openings, is not the correct standard for the violation alleged--failure to guard a skylight opening. It is well settled that a flat roof is not a floor. Central City Roofing Co., Inc., 76 OSAHRC 45/B12, 4 BNA OSHC 1085, 1976-77 CCH OSHD ¶20,761 (No. 8173, 1976). Moreover, there is a specific standard for guarding of skylight openings, §1926.500(f)(6), which provides:

> Skylight openings that create a falling hazard shall be guarded with a standard railing, or covered in accordance with subparagraph (5)(ii) of this paragraph.

---

2 §1926.450(a)(9), pertaining to general requirements for ladders, provides:

> The side rails shall extend not less than 36 inches above the landing. When this is not practical, grab rails, which provide a secure grip for an employee moving to or from the point of access, shall be installed.

3 §1926.500(b)(1) provides:

> Floor openings shall be guarded by a standard railing and toe boards or cover, as specified in paragraph (f) of this section. In general, the railing shall be provided on all exposed sides, except at entrances to stairways.

Since there is no question but that the skylight opening here involved was unguarded, item 1 of citation 2, alleging a willful violation of §1926.500(b)(1), will be amended sua sponte to allege a willful violation of §1926.500(f)(6). Rodney E. Fossett d/b/a Southern Lighweight Concrete Co., 79 OSAHRC 92/D2, 7 BNA OSHC 1915, 1979 CCH OSHD ¶23,989 (No. 76-3944, 1979).

An OSHA compliance officer, Donald Valentine, inspected a construction site at 11381 Meadowglen Lane in Houston after an employee was fatally injured in a fall through an unguarded skylight opening. In the course of the inspection, Valentine noted that an access ladder to the roof did not have siderails extending the required 36 inches above the landing. Ownership of the ladder was not established, but it provided the only access to the roof and was used by the roofers and others (Tr.171).

Jackie L. Perkins identified himself to Valentine as the foreman of the roofing crew. Perkins denied representing himself as a Farrell employee (Tr.173), and Valentine's testimony on this point is somewhat equivocal (Tr.118,119). Darlene Webb Blackburn, secretary to a Farrell official, reported the fatality to OSHA and Farrell's workmen compensation carrier, giving Farrell as the decedent's employer in both instances (Exhibits C-6 and C-14). However, the evidence clearly shows that the decedent was not a Farrell employee but was employed by Perkins, an independent contractor to whom Farrell had subcontracted this roofing job.

Perkins' statements to Valentine are hardly binding on Farrell, especially since they had the effect, if indeed not the intent, of avoiding liability to himself. Although Mrs. Blackburn handled insurance claims for Farrell and its subcontractors, she had no official capacity which would make

her representations binding on Farrell in the absence of ratification.

In any event, it is clear from a preponderance of the evidence that Perkins was in fact an independent contractor and that he was the employer of the roofing crew. It was Farrell's practice to use five or six such subcontractors to supplement its own crews, since it was difficult to anticipate far enough in advance just when the various construction jobs would be ready for roof work. Most of its subcontractors had no workmens compensation policies of their own, so Farrell, to avoid the risk of itself becoming liable, arranged with its own carrier to have its subcontractors' employees covered by Farrell's policy. Farrell deducted the insurance premiums from moneys earned by its subcontractors and remitted same to the carrier (Tr.209-212; Exhibits R-6, R-7, R-8). Neither Perkins nor any of his crew was carried on Farrell's payroll (Tr.205; Exhibit R-8). Perkins reported on his 1980 U.S. individual income tax return that he was self-employed as Jackie L. Perkins Roofing (Tr.169, Exhibit R-2).

The next question is whether Farrell exercised enough supervisory control over the workplace that it reasonably could have been expected to detect the violative conditions and require them to be abated. Such a rule has been applied to general contractors, as in Knutson Construction Co., 76 OSAHRC 131/F3, 4 BNA OSHC 1759, 1976-77 CCH OSHD ¶21,185 (No. 765, 1976), aff'd, 566 F. 2d 596 (8th Cir., 1977) and has been extended to others than general contractors in analogous situations, as in Red Lobster Inns of America, Inc., 80 OSAHRC 73/A14, 8 BNA OSHC 1762, 1980 CCH OSHD ¶24,636 (No. 76-4754, 1980).

Here, however, the evidence establishes that Farrell did not actually

supervise Perkins' work but merely checked to see how much work he had completed when he asked for a "draw" or partial payment (Tr.164,216). He was not told how the work was to be performed (Tr.158). The subcontract between Farrell and Perkins (Exhibit R-1) reserved no supervisory authority in Farrell.

No doubt Farrell could have asserted such supervisory authority, and in reality that is the only basis for holding it responsible for the safety violations. I hold this is not enough.

On a somewhat different question, whether a construction manager or an architect is engaged in construction work so as to be subject to the construction standards, the Commission has based its determination on whether the employer was performing actual construction work or exercising substantial supervision over actual construction. Skidmore, Owings & Merrill, 78 OSAHRC 1/A2, 5 BNA OSHC 1782, 1977-78 CCH OSHD ¶22,101 (No. 2165, 1977); Cauldwell-Wingate Corp., 78 OSAHRC 39/A2,1978 CCH OSHD ¶22,729 (Nos. 14620 & 14858, 1978). It is clear that Farrell did not exercise substantial supervision over the roofing job. Therefore, these citations must be vacated.

The appropriate penalty.

There remains the assessing of an appropriate penalty for the one violation found.

Section 17(j) of the Act requires the Commission, in assessing penalties, to consider the gravity of the violation and the employer's size, good faith and history of previous violations. These factors need not be accorded equal weight, but the gravity is usually of greater significance than the others. Colonial Craft Reproductions, 72 OSAHRC 11/B10, 1 BNA OSHC 1063, 1971-73 CCH OSHD ¶15,277 (No. 881, 1972). Elements to be considered in determining

gravity include the number of employees exposed to the risk of injury, duration of the exposure, precautions taken against injury, and the degree of probability of occurrence of an injury. National Realty & Construction Co., Inc., 72 OSAHRC 9/A2, 1 BNA OSHC 1049, 1971-73 CCH OSHD ¶15,188 (No. 85,1972) rev'd on other grounds, 489 F.2d 1257 (D.C. Cir., 1973).

After considering the statutory criteria, I find a penalty of $250 to be appropriate for Farrell's violation of §1926.500(g)(1).

## FINDINGS OF FACT

1. Farrell is an employer engaged in a business affecting commerce, who has employees, within the meaning of §3(5) of the Act.

2. On March 23, 1981, Farrell was putting a built-up roof on the essentially flat roof of a building at Fairbanks North Houston at Highway 290, Houston, Texas. Its employees were working within one or two feet of the edge of the southwest corner without any fall protection except safety monitoring by the foreman, Charley Wright, or persons designated by him. The roof was between 100 and 150 feet wide and between 400 and 500 feet long. The roof was 21 or 22 feet high, and a fall therefrom probably would result in death or serious physical injury. A penalty of $250 is appropriate for this violation. There is no evidence of a violation of the roof-guarding standard at the northeast corner of the building as alleged.

3. On March 18, 1981, Jackie L. Perkins, an independent roofing contractor acting under a subcontract with Farrell, was putting a built-up roof on a building at 11381 Meadowglen Lane, Houston, Texas, when an employee fell through an unguarded skylight opening and was fatally injured. Access

to the roof was provided by a ladder the siderails of which reached only 26 inches above the landing on the roof. Neither Perkins or any member of his crew was employed by Farrell. Farrell exercised no supervisory authority over Perkins' crew or the construction site and could not reasonably have been expected to detect and abate, or cause to be abated, the violative conditions.

## CONCLUSIONS OF LAW

1. The Commission has jurisdiction of the parties and of the subject matter of this proceeding.

2. On March 23, 1981, Farrell was in serious violation of 29 CFR 1926.500(g)(1) as alleged in subitem 1(b) of citation 1, issued to it on March 30, 1981, but not as alleged in subitem 1(a) thereof.

3. On March 18, 1981, Farrell was not in violation of 29 CFR 1926.450(a)(9).

4. Item 1 of citation 2, issued to Farrell April 3, 1981, should be amended to allege a violation of 29 CFR 1926.500(f)(6) rather than 29 CFR 1926.500(b)(1).

5. On March 18, 1981, Farrell was not in violation of 29 CFR 1926.500(f)(6).

## ORDER

1. Item 1 of citation 1, issued to Farrell March 30, 1981, alleging a serious violation of 29 CFR 1926.500(g)(1), is AFFIRMED and a penalty of $250 is ASSESSED.

2. Item 1 of citation 1, issued to Farrell April 3, 1981, alleging a serious violation of 29 CFR 1926.450(a)(9) is VACATED.

3. Item 1 of citation 2, issued to Farrell April 3, 1981, is amended to allege a willful violation of 29 CFR 1926.500(f)(6), and, as so amended, it is VACATED.

4. The Secretary's requested findings of fact and conclusions of law, to the extent that they are inconsistent with this decision, are denied.

NOTICE OF DECISION

Secretary of Labor v. Longerier Construction Company
OSHRC Docket No. 80-4245

1. Enclosed is a copy of my decision. It will be filed with the Commission on January 12, 1982, and will become the final order of the Commission on February 11, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is February 11, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

Stanley M. Schwartz
Administrative Law Judge

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR,<br>Complainant,<br>v.<br>LONGCRIER CONSTRUCTION COMPANY,<br>Respondent. | OSHRC DOCKET NO. 80-4245 |

Appearances:

George R. Collins, Esq.
Dallas, Texas

For the Complainant.

David J. White, Esq.
Dallas, Texas

For the Respondent.

DECISION AND ORDER

SCHWARTZ, Judge:

This is a proceeding brought before the Occupational Safety and Health Reveiw Commission ("The Commission") pursuant to Section 10 of the Occupational Safety and Health Act of 1970, 29 USC §651 et. seq. ("the Act"). Respondent contests a serious citation containing three alleged violations of the Act and a non-serious citation alleging four violations of the Act. Complainant withdrew item number 1 of the non-serious citation at the hearing.

An inspection was conducted at Respondent's workplace on June 10, 1980. The Longcrier Company timely contested the subject citations. A hearing was held in Dallas, Texas, on September 25, 1981. No additional persons desired to intervene in this matter. Both parties have filed post-hearing briefs.

Respondent concedes that it is engaged in a business affecting commerce within the meaning of the Act and that the Commission has jurisdiction of the parties and subject matter. The issues remaining to be decided are two-fold. First whether the Respondent was in Serious violation of 29 CFR 1926.451(a)(4); 1926.500(e)(1)(iv); 1926.501(f) and non-serious violation of 1926.400(h)(1); 1926.401(a)(1); and 1926.500(e)(1)(iii). If so the appropriate penalty therefor.

## THE EVIDENCE

The Secretary presented its compliance officer, Mr. George Davis. He has been with OSHA for seven years and has previous experience as a safety technician and safety engineer (T. 7-8). He conducted an inspection of Respondent's workplace on June 10, 1980. He observed two men on a scaffold approximately 15 feet high. The scaffold did not have guardrails (T. 10, C's Exh. 1&2). He was told by the management official who accompanied him on the walkaround that they were Respondent's employees on the scaffold (T. 28).

Mr. Davis also observed that there were no guardrails on the inside stairways leading to the upper floors. He testified that he determined the width of the stairways with a tape measure and that the stairway had more than four risers. Respondent had 47 employees on the jobsite and the stairway was the only access to the upper floors of the building. The other stairwell was closed off. He also observed that the pans in the stairwell were not filled from the fourth to the eighth or ninth floor. The pans have nosings which become tripping hazards. Wooden fillers would correct this problem (T. 13-19; C's Exh 3&4).

The compliance officer also testified concerning the lack of ground-fault interrupters on the electrical system or an assured equipment grounding program. He also observed an electric handsaw which was ungrounded and plugged up. He completed his testimony by indicating that the steps leading into the ground floor of the building only had one guardrail. He determined the width of the stairway was less than 44 inches by measuring it. It has more than four risers (T. 19-25; C's Exh. 5-7).

Respondent called Ms. Barbara Blount. She is Vice President of Administration for the Longcrier Company which includes responsibility for safety matters. The company was formed in 1978. The subject project was one of the earliest undertakings of the company (T. 33-35).

Ms. Blount testified concerning the company's safety program. The company adopted the "Manual of Accident Prevention and Construction" published by the Associated General Contractors of America as the safety manual for the subject project. It conducted weekly safety meetings open to subcontractors and employees on the jobsite at which safety topics were outlined and discussed (T. 38-41). Respondent also expended funds for the use of safety equipment including safety belts to be used on the job (T. 37-38). Employees had been issued instructions to wear safety belts when they were at a height such as that depicted in complainant's exhibit 1 & 2. The policy of the company was to enforce the safety regulations with reprimands and disciplinary action (T. 41).

## OPINION

### 29 CFR 1926.451(a)(4) - Lack of Guardrails

There is no question that two of Respondent's employees were observed on a 15 foot high scaffold which did not have guardrails. Respondent contends that the presence of these men on the scaffold without a guardrail constituted an isolated

incident of employee misconduct. It is well established that in order to defend successfully against a citation on the grounds that a violation arose from unpreventable employee misconduct, an employer must establish that the action of the employee was a departure from a uniformly and effectively communicated and enforced work rule designed to prevent the non-compliance. Laclede Gas Company, 79 OSAHRC 94/E13, 7 BNA OSHC 1874, 1978, 1979 CCH OSHD ¶24,007, at 29, 154 (No. 76-3241, 1979); Jensen Construction Company, 79 OSAHRC 49/D3, 7 BNA OSHC 1477, 1479, 1979 CCH OSHD ¶23,664 at 28,695 (No. 76-1538, 1979). The evidence has been considered within the parameters of this test. Respondent has failed to establish its affirmative defense. My reasons follow.

Respondent indicates it had a general rule that employees should wear safety belts when performing work on scaffolds 15' above the ground. In addition Respondent included a safety reminder in one weekly safety meeting to "spot and report missing guardrails". This meeting was held in February 1980 some four months before the inspection.

I cannot conclude that the above efforts constitute effective communication of a specific workrule to employees concerning the need to be protected when working on scaffolds 15' high. The two employees were in an area readily accessible to Respondent's management personnel. There is no probative evidence that the foreman of these two employees was even aware of the subject workrules. Nor does the record establish that the foreman with responsibility for this area made a reasonably diligent effort to anticipate and detect these hazards. Finally the record does not establish that the general instructions mentioned above were adequate to inform employees of hazards peculiar to the construction job being performed at the Sanger-Harris center in June 1980. Respondent's generalized testimony by Ms. Blount fails to establish that Longcrier took all necessary precautions to prevent the occurrence of the violation in this case.

Respondent's alternative argument is that the degree of the violation should be reduced from serious to non-serious because of the limited fall hazard. It is well settled that a serious violation is established if there is a possibility of an accident which, if it occurs, creates a substantial probability that death or serious injury will result. Portland Stevedoring Co., 73 OSAHRC 30/A2, 1 BNA OSHC 1250, 1973-74, CCH OSHD ¶16,347 (No. 5, 1973).

I conclude that the record establishes that the resulting harm would be death or serious physical harm. The compliance officer gave his opinion that a fall would present a substantial probability of death or serious physical harm. This opinion is supported by a review of Complainant's exhibits 1 & 2. The scaffold is 15' high with no protection whatsoever such as guardrails to prevent a fall off the back edge. The ground appears hard and is covered with various materials which would add to the severity of the fall. Consequently I conclude the violation was serious.

The remaining issue concerns the assessment of an appropriate penalty. Respondent has failed to establish the specific defense of unpreventable employee misconduct. This defense is a difficult one to establish. However, this failure does not detract from the fact that Ms. Blount and Longcrier have established a good general safety program. I have observed Ms. Blount and believe she is totally committed to safety at the workplace. In addition the fall distance was in that gray area of 10'-15'. The violation was serious as set forth above. However the probability of an accident was described as low by the compliance officer. Finally Ms. Blount testified that Longcrier had no history of prior violations before the June 10, 1980, inspection. The only citation which had been issued was withdrawn by the Secretary in another case. The proposed $400 penalty would not further the purposes of the Act. On balance I conclude that a penalty of $75 is appropriate.

## FINDINGS OF FACT

1. Respondent's employees were working on a scaffold 15' above the ground on June 10, 1980.

2. The scaffold did not have guardrails and the employees were not wearing tied off safety belts.

3. Respondent with the exercise of reasonable diligence could have learned of the violative condition.

4. There was a substantial probability that death or serious physical injury could result from Respondent's failure to protect its employees by the use of guardrails or safety belts.

## 29 CFR 1926.500(e)(1)(IV) and 29 CFR 1926.501(f)

Complainant combined 1926.500(e)(1)(iv) and 1926.501(f) to constitute a single serious violation. 29 CFR 1926.500(e)(1)(iv) provides:

> "(1) Every flight of stairs having four or more risers shall be equipped with standard stair railings or standard handrails as specified below, the width of the stair to be measured clear of all obstructions except hendrails:
>
> (iv) On stairways more than 44 inches wide but less than 88 inches wide, one handrail on each enclosed side and one stair railing on each open side;"

Respondent contends that Complainant has failed to establish an essential element of proof. I agree. The compliance officer testified that he determined the width of the stairway with a tape measure. However he did not testify as to his findings with respect to the width of the stairs. Consequently there is no evidence to base a finding that the subject stairway was between 44" and 88" wide. Absent such evidence Complainant has failed to establish the applicability of the cited standard to the stairway in issue. Consequently this item of the citation must be vacated.

The second item concerns an alleged violation of 29 CFR 1926.501(f). This regulation provides as follows:

> "Permanent steel or other metal stairways and landings with hollow pan-type treads that are to be filled with concrete or other materials, when used during construction, shall be filled to the level of the nosing with solid material. The requirement shall not apply during the period of actual construction of the stairways themselves.

Respondent contends the standard was not violated because the inspection took place during a period of time when the stairway was under actual construction. It argues that the stairway must be considered to be in a state of actual construction since the pans were yet to be filled. Thus Respondent attempts to come within the exception contained in the last sentence of 29 CFR 1926.501(f).

Complainant argues that the stairs were completed in this case within the meaning of the cited regulation. I agree. The stairway, in question, was the only access to the upper floors of the project. The only portion remaining to be completed was the filling in of the steps with concrete or other materials. The standard intends to except stairways as they are being constructed. It recognizes that once a framework has been established there is usually a time lag before the steps are filled. It is this hazard that must be protected against by the use of temporary solid materials. Respondent's own safety rules recognized that solid fillers should be used until the hollow pan stairs could be filled with concrete. Consequently Complainant has established a violation of 29 CFR 1926.501(f).

The question remaining to be resolved is whether item 2(b), 29 CFR 1926.501(f) standing alone can be considered a serious violation within the meaning of the definition set forth above. Complainant cited the lack of stair railings and the hollow pan-type treads as a combination violation. Stated another way the two violations, if taken together, presented a substantial probability of death or serious physical harm. However the compliance officer indicated that the basic hazard

was a tripping hazard because the workers' feet don't fit in the nosings. A tripping hazard has consistently been cited as a non-serious violation by Complainant. The hazard which concerned the compliance officer was tripping and falling off the side of the stairway. This combination of hazards is no longer present. Consequently a non-serious violation with no penalty is appropriate.

NON-SERIOUS VIOLATIONS - 1926.400(h)(1); 1926.401(a)(1); and 1926.500(e)(1)(iii)

Complainant has established a prima facie case with respect to the lack of ground-fault interrupters, unguarded electric handsaw and steps less than 44 inches wide with only one guardrail. The compliance officer observed these conditions on the day of the inspection. Consequently Complainant has carried its burden of proof on these items and they are affirmed.

## CONCLUSIONS OF LAW

1. Respondent Longerier Construction Co. is engaged in a business affecting commerce and has employees within the meaning of Section 3(5) of the Act. The Commission has jurisdiction of the parties and of the subject matter of the proceeding.

2. On June 10, 1980, Respondent was in serious violation of 29 CFR 1926.451(a)(4) and non-serious violation of 29 CFR 1926.501(f); 1926.400(h)(1); 1926.401(a)(1); and 1926.500(e)(1)(iii).

3. On June 10, 1980, Respondent was not in serious violation of 29 CFR 1926.500(e)(1)(iv).

## ORDER

On the basis of the foregoing Filndings of Fact and Conclusions of Law, it is ORDERED that:

1. Item 1 of serious citation number 1 is AFFIRMED.

2. Item 2(b) of serious citation number 1 is affirmed as a non-serious violation.

3. Items 2, 3, & 4 of non-serious citation number 2 are affirmed.

4. Item 2(a) of serious citation number 1 and item 1 of non-serious citation number 2 are VACATED.

5. A penalty of $75 is assessed for Item 1 of serious citation number 1 and no penalty is assessed for the non-serious violations.

STANLEY M. SCHWARTZ
Administrative Law Judge

| LONGCRIER CONSTRUCTION COMPANY, | : |
| Respondent. | : |

## SECRETARY'S PETITION FOR DISCRETIONARY REVIEW

Complainant, the Secretary of Labor, being aggrieved by the Decision and Order of the Administrative Law Judge in the above matter, hereby submits this Petition for Discretionary Review pursuant to § 2200.91 of the Rules of Procedure of the Occupational Safety and Health Review Commission.

## STATEMENT OF PORTIONS OF THE DECISION AND ORDER TO WHICH EXCEPTION IS TAKEN

The Secretary takes exception to that portion of the Decision and Order in which the administrative law judge vacated the serious citation for violation of 29 CFR 1926 .500(e)(1)(iv)[1/] on the grounds that there was no evidence

---

1/ 29 CFR 1926.500(e)(1)(iv) requires:

> On stairways more than 44 inches wide but less than 88 inches wide, one handrail on each enclosed side and one stair railing on each open side;

regarding the width of the cited stairway (J.D. 6). The Secretary further takes exception to the judge's reduction of the characterization of a second item of that citation, for violation of 29 CFR 1926.501(f), 2/ from serious to non-serious.

STATEMENT OF REASONS FOR WHICH EXCEPTION IS TAKEN

1. The administrative law judge erred in holding that the cited standard did not apply to the stairway at issue because there was "no evidence to base a finding that the subject stairway was between 44" and 88" wide (J.D. 6). The citation and complaint alleged the stairway to be 60 inches wide, but, as the judge found, this fact was not specifically established in the record (see Tr. 14). However, even absent proof of the exact width of the stairway, a violation of 1926.500(e)(1) should have been affirmed. Section 1926.500 (e)(1) provides:

> (e) Stairway railings and guards.(1) Every flight of stairs having four or more risers shall be equipped with standard stair railings or standard handrails as specified below, the width of the stair to be measured clear of all obstructions except handrails:

---

2/ 29 CFR 1926.501(f) states in pertinent part

> Permanent steel or other metal stairways, and landings with hollow pan-type treads that are to be filled with concrete or other materials, when used during construction, shall be filled to the level of the nosing with solid material.

Immediately following in the standard is a list of five specific situations reflecting the width of the stairway and whether the stairway is open or enclosed. What is important to this case is that regardless of width a stairway with one or more open sides must be equipped with a stair railing on each open side:

> (i) On stairways less than 44 inches wide having both sides enclosed, at least one handrail, preferably on the right side descending;
> (ii) On stairways less than 44 inches wide having one side open, <u>at least one stair railing on the open side;</u>
> (iii) On stairways less than 44 inches wide having <u>both sides open</u>, <u>one stair railing on each side;</u>
> (iv) On stairways more than 44 inches wide but less than 88 inches wide, one handrail on each enclosed side and <u>one stair railing on each open side;</u>
> (v) On stairways 88 or more inches wide, one handrail on each enclosed side, <u>one stair railing on each open side</u>, and one intermediate stair railing located approximately midway of the width.

(emphasis added). Because it is undisputed that the cited stairway had more than four risers and was not equipped with a railing on the open side (Tr. 14, Exhibits C-3 and C-4), respondent was clearly in violation of either subsection (ii) or subsection (iv) or subsection (v). Thus, a violation of 29 CFR 1926.500(e)(1) should have been affirmed even though, in view of the lack of proof of width, a particu-

lar subsection of that standard cannot be specified. [3/] To hold otherwise would be an elevation of form over substance in a case in which absolutely no prejudice to respondent would result form affirmance of a citation under .500(e)(1).

2. The judge further erred in holding that, although the combination of open-sided stairways and unfilled pan treads on the same stairway was a serious hazard (J.D. 7), without that combination the second item alone was only a non-serious violation. It follows that if the first item of the citation is reinstated for the reasons discussed above, then the violation of .501(f) should be affirmed as serious. Moreover, the judge notes that "the hazard which concerned the compliance officer was tripping and falling off the side of the stairway" (J.D. 8). Contrary to the judge's statement (id), the "combination of hazards" was still present even though he believed he could not affirm the first item of the citation because of a technical deficiency in the Secretary's evidence. In other words, vacation of the first item, even if affirmed by the Commission, does not alter the plain fact that the open-sided stairway exposed respondent's em-

---

3/ The violation would be for failure to equip the stairway with a railing on the open side. Because the Secretary did not establish the stairway to be more than 44 inches wide, he does not request the Commission to find a violation with respect to the absence of a railing on the enclosed side. Subsection (ii) of 1926.500(e)(1) indicates that a stairway less than 44 inches wide need not have a railing on the enclosed side. Accordingly, the citation should be for violation of 1926.500(e)(1), since it is clear that one of the subsections of that standard applies to the cited stairway.

ployees to a fall from one floor to the next, on four or five separate floors (J.D. 2; Tr. 13-19). On these facts, the harm from an employee tripping and falling from these stairs would undoubtedly be serious. Portland Stevedoring Co., No. 5, 1973-74 CCH OSHD ¶16,347 (R.C. 1973)

For the above reasons, the Secretary respectfully requests that the Commission grant this Petition for Discretionary Review.

Respectfully submitted,

NOTICE OF DECISION

Secretary of Labor v. Hutton Electric Company
OSHRC Docket No. 80-5714

1. Enclosed is a copy of my decision. It will be filed with the Commission on January 12, 1982, and will become the final order of the Commission on February 11, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is February 11, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

## DECISION AND ORDER

SCHWARTZ, Judge:

This is a proceeding brought before the Occupational Safety and Health Reveiw Commission ("The Commission") pursuant to Section 10 of the Occupational Safety and Health Act of 1970, 29 U.S.C. §651 et. seq. ("the Act"). Respondent contests an alleged serious violation of 29 C.F.R. 1926.400(a), 1926.401(a)(1) and 1926.400(h)(1). A hearing was held in this matter on September 24, 1981. No additional parties desired to intervene. Complainant withdrew item 1(c) of the citation, 29 CFR 1926.400(h)(1) at the hearing.

Respondent concedes that it is engaged in a business affecting commerce within the meaning of the Act. The issues remaining to be decided are two-fold.

First whether the Respondent was in serious violation of the two aforementioned standards. If so, the appropriate penalty therefor.

## EVIDENCE

Mr. Ronald H. Sarnacki, an OSHA compliance officer appeared and testified on behalf of the complainant. He conducted an inspection of Respondent's workplace on July 29, 1980. Mr. Sarnacki observed a four receptacle plug which was missing a cover. He testified that this condition exposed employees to live conductors. He also observed a Greenlee hydraulic pump which he cited for improper grounding due to the improper grounding of the same four receptacle plug. He testified that the pump itself was properly grounded internally (T. 6-8).

The compliance officer also testified concerning his conversations with Mr. Paul Carter, Respondent's foreman. Mr. Carter told him the Greenlee hydraulic pump had been plugged into the receptacle and had been used by him on the day prior to the inspection July 28, 1980. Mr. Sarnacki conceded the pump was not in operation during the inspection and he did not witness any Hutton employee within proximity of the pump (T. 9, 16). Mr. Sarnacki also testified that on the day of the inspection the Greenlee pump in question was not plugged into the receptacle (T. 16). On redirect examination Mr. Sarnacki answered "No" to the question of whether Mr. Carter told him that he had made any changes in the receptacle since the time he had used it on the day before (T. 17).

## OPINION

Complainant presented the compliance officer Mr. Sarnacki and rested its case. Respondent moved to dismiss the citation on the ground that the complainant failed to establish employee exposure to the alleged violations. The undersigned reserved ruling on the motion. Respondent rested its case on the motion to dismiss. Both parties have filed post-hearing briefs.

To prove a violation of section 5(a)(2) of the Act, 29 U.S.C. §654 (a)(2), the Secretary must demonstrate by a preponderance of the evidence an employer's noncompliance with an applicable standard and employee access to the hazard created by the violative condition. Otis Elevator Co., 78 OSAHRC 88/E5, 6 BNA OSHC 2048, 1978 CCH OSHD ¶23,135 (No. 16057, 1978). The Secretary need not establish a fact with absolute certainty. However the evidence must convince the trier of fact that the existence of the fact the Secretary seeks to prove is more likely than not. Anaconda Aluminum Co., 9 BNA OSHC 1460, 1465, 1981 CCH OSHD ¶25,300 (No. 13102, 1981).

Applying the preponderance of evidence test, the resolution of this case is reduced to the question of whether based upon all the evidence, the fact asserted by Complainant, that Hutton's foreman Carter used the receptacle in an uncovered condition on the previous day is more likely than not.

The Secretary relies entirely on Compliance Officer Sarnacki's recounting of Hutton's foreman Carter's statement concerning the use of the subject receptacle. There is no question that Mr. Carter used the receptacle on the day prior to the inspection. The only other evidence on the issue concerned Mr. Sarnacki's answer to a question on redirect. He answered "No" to the question whether Mr. Carter told him that he had made any changes in the receptacle since the time he had used it on the day before.

Complainant contends that I should infer from this testimony that the receptacle was uncovered on the day Mr. Carter used it. I disagree. Respondent correctly points out that the testimony by no means indicates that the condition of the receptacle had not changed since it had been used. It merely shows that Mr. Carter did not tell the compliance officer of any change in the condition of the receptacle. The fatal flaw in Complainant's argument is that the suggested

inference is not valid in this case because the condition of the receptacle is by no means a condition which is permanent in nature. The condition of the receptacle could change on a construction site within a one hour period or less. The compliance officer should have established whether the receptacle was uncovered by asking Mr. Carter. Recounting of an affirmative answer to the question would have convinced me that it was more probable than not the receptacle was uncovered when Foreman Carter used it. The burden would have then shifted to the Respondent. Absent such evidence I conclude the Complainant has failed to establish that Respondent's employees had access to the unguarded receptacle on the day prior to the inspection as asserted in this case.

## FINDINGS OF FACT

1. The Compliance Officer did not observe anyone operate the hydraulic pump on the day of the inspection.

2. At no time during the inspection did the Compliance Officer witness or have knowledge that any Hutton employee was within the proximity of the pump or receptacle.

3. The hydraulic pump was not plugged into the receptacle at any time during the subject inspection.

4. There is no evidence in the record that establishes the receptacle was in the same condition at the time of its use by Respondent's foreman on July 28, 1980, as it was at the time of the inspection on July 29, 1980.

## CONCLUSIONS OF LAW

1. Respondent, Hutton Electric Company, is engaged in a business affecting commerce and has employees within the meaning of Section 3(5) Of the Act. The Commission has jurisdiction of the parties and of the subject matter of the proceeding.

2. On July 28 & 29, 1980, Respondent was not in serious violation of 29 CFR 1926.400(a); 1926.401(a)(1); and 1926.400(h)(1).

## ORDER

On the basis of the foregoing Findings of Fact and Conclusions of Law it is ORDERED that:

1. Items 1(a), 1(b), and 1(c) of Serious Citation number 1 are VACATED.

STIPULATED NOTICE OF DISMISSAL

Raymond J. Donovan, Secretary of Labor, United States Department of Labor, Complainant, Bethlehem Steel Corporation, Respondent, Local 2599, United Steelworkers of America, Authorized Employee Representative, parties to the above-captioned matter, in order to resolve the contest herein agree and stipulate as follows:

1. On January 17, 1979, Complainant issued to Respondent a serious citation for an alleged violation of Section 5(a)(1) of the Occupational Safety and Health Act of 1970, 29 U.S.C. §654(a)(1). The citation specified the violation as follows:

> Operators of "Hyster" straddle carrier number 260 which was operated and stored in the Structural Steel and Auxiliary Structural Steel Yard, did not have adequate vision from the carrier cab to the front and right sides of the carrier, November 22, 1978 to January 5, 1979.

2. Respondent timely contested the citation and the matter was referred to the Occupational Safety and Health Review Commission

FEB 1982

("the Commission") for adjudication.

3. The Authorized Employee Representative elected and was accorded party status before the Commission.

4. A hearing was held before the Commission's Administrative Law Judge Alfieri who, thereafter on January 24, 1980, filed a Decision and Order with the Commission. In his Decision Judge Alfieri vacated the citation for several reasons including his finding that while limited carrier visibility created a hazard and while Respondent had knowledge of the hazard, nonetheless the evidence did not establish the feasibility and likely utility of the Secretary's suggested means of abatement, i.e., mirrors mounted on the carrier.

5. None of the parties petitioned the Commission for review of the judge's decision. Nevertheless, Commissioner Cottine, on February 25, 1980, directed the judge's decision for review to consider:

> Whether the Judge erred in vacating the citation alleging a violation of 29 U.S.C. §654(a)(1) on the basis that "the Secretary did not carry his burden of proof that Respondent violated the general duty clause."

6. On December 10, 1981, the Commission issued a briefing notice to the parties.

7. Since the issuance of the briefing order the parties have discussed the case and the record. From this review the parties have determined that the record supports the decision of the judge.

Complainant, in view of the foregoing and in reliance on respondent's assertions that the carrier, in addition to its clearly visible size and shape, is equipped with certain devices intended

to alert employees to the approach of the carrier, agrees to withdraw the citation and notification of proposed penalty.

Respondent, in view of the foregoing agrees to withdraw its notice of contest.

The Authorized Employee Representative has no objections to the above withdrawals.

WHEREFORE, in the light of the foregoing the parties agree that there is no longer any contest or controversy as to this case and agree to the dismissal of this matter and the entry of a final order in accordance with the terms herein.

DECISION AND ORDER

Edward V. Alfieri, Judge.

## STATEMENT OF THE CASE

This is a proceeding under section 10 of the Occupational Safety and Health Act of 1970, 29 U.S.C. 651 et seq. (the Act). It involves an inspection initiated by the fatal accident of Mr. Calvin Smith, an employee of the Philadelphia, Bethlehem and New England Railroad, a wholly-owned subsidiary of Respondent.

## BACKGROUND

The events leading to the accidental death are essentially undisputed. On November 22, 1978, while working in the 25 run area of the structural steel yard, brakeman Smith was uncoupling and blocking a gondola railroad car on track No. 513. After uncoupling the railroad car from an engine, Smith, walking in a southerly direction towards the yard roadway, took two or three steps away from the railroad car, and came in contact with the right side of Hyster straddle carrier No. 260 (the 260 carrier) driven by Herbert Nicholas.

During November 28, 1978 and January 8, 1979, Michael Glowatz, the Secretary's Compliance Officer, visited the scene of the accident and inspected the 260 carrier. He also interviewed the operator Nicholas and two witnesses to the accident, crane operators Rhoback and Deutsch.

Based on the inspection and the information gathered by Glowatz, the Secretary issued a citation to Respondent on

January 17, 1979. It charged Respondent with a violation of the general duty clause, section 5(a)(1) of the Act, 29 U.S.C. section 654(a)(1). That section provides:

> "Each employer shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or likely to cause death or serious physical harm to his employees."

The alleged violative condition is described as follows:

> Operators of "Hyster" straddle carrier number 260, which was operated and stored in the Structural Steel and the Auxiliary Structural Steel Yard, did not have adequate vision from the carrier cab to the front and right sides of the carrier, November 22, 1978 to January 5, 1979.

Immediate abatement was called. A penalty of $1,000.00 is sought by the Secretary.

The issues to be determined are whether or not Respondent failed to comply with the general duty clause and if so, is the penalty proposed appropriate.

Testimony of Compliance Officer Michael Glowatz

At the scene of the accident Respondent's safety engineer Mr. Serfass, explained to him how the accident happened. Glowatz then took several photographs[1] which were placed in evidence. He explained that Exhibit C-8 showed a locomotive and a railroad car positioned similarly to the ones from which Smith walked

---

1 Exhibits C-1 through C-23.

when he was fatally injured (Tr. 16). Testifying about Exhibit C-9, Glowatz said it showed that the track in the front of the photograph was about eight feet from the railroad cars (Tr. 17).

He estimated that the 260 carrier was 19 to 20 feet long, the operators cab 101 inches above the ground, set back 83 inches from the front end and 67 inches in from the front of the right side (Tr. 19, Exhibits C-16, 19, 20 and 21).

Glowatz tested the field of vision from the 260 carrier operator's cab by having Union Representative Kametz stand at various places along the right side of the 260 carrier. When standing 66 inches away from the 260 carrier's side Kametz could not be seen from the cab.

Kametz could not be seen when standing 52 inches from the front right section of the 260 carrier. Glowatz could barely see the top of the yellow hard hat worn by Kamitz who had moved to 54 inches. Kamitz's height with the hard hat on was 5 feet 11 1/2 inches. The test also showed that in order for the 260 carrier's operator to see a 6 foot 3 inches high object, it had to be 5 1/2 feet away from the 260 carrier's right side (Tr. 22-25, Exhs. C-13, 14 and 15).

Glowatz drew the conclusion that the limited visibility on the right side of the 260 carrier was a recognized hazard in the industry because:

1. Carriers made by the Clark Equipment Company had, as standard equipment, convex mirrors mounted on the handrail to

provide vision at the front and at the right rear (Tr. 36, Exh. C-23).

2. National Safety Council data sheet #257[2] relating to Gantry Trucks,[3] informs the reader about the blind spots on some model carriers and particularly the older models[4] (Exh. C-22).

Glowatz attributed knowledge of the hazard directly to Respondent because it is a member of the National Safety Council (Tr. 38). However, he did not know when the data sheet #257 was published, if Respondent ever received a copy of it from the council, when Respondent purchased either the 260 carrier involved in the accident or purchased any of its other carriers (Tr. 39).

According to Glowatz the violative conditons could be abated. He suggested that convex mirrors be placed on the perimeter of the 260 carrier at the right rear and left front as they are on the carrier made by Clark Equipment Company (Tr. 42-43). This would eliminate much of the blind spot and afford the 260 carrier operator better visibility of the front side (Tr. 43). The mirrors are available from both Clark (Exh. C-23) and Hyster (Tr. 43).

---

2 Prepared by Industrial Department, National Safety Council, 444 N. Michigan Avenue, Chicago, Illinois.

3 Also known as "hysters" and straddle trucks."

4 Item 6 of Exh. C-22.

In arriving at an unadjusted penalty of $1,000.00 Glowatz considered the serious nature of the violation, the number of employees exposed, the time of their exposure and the high probability of an accident occuring. He made no adjustment for size, because Respondent has 14,000 employees, none for history because of prior violations and none for good faith because of Respondent's reluctance to abate (Tr. 49-50).

On cross-examination, Glowatz said that he was speculating when he testified that Smith was struck by the 260 carrier (Tr. 57). He was also uncertain that the convex mirrors when used as he suggested would have helped either to avoid the accident or lessen the severity of injury (Tr. 73). He agreed that Smith's fatal accident was similar to accidents that occur when a pedestrian unexpectedly walks from between parked cars (Tr. 73).

Glowatz was asked to examine a specification sheet for the Clark 60,000 lbs. carrier which is similar to the subject 260 carrier (Tr. 62-64, Exh. R-45), another for a Gerlinger carrier (Tr. 64, Exh. R-46) and a third one for the Hyster 260 carrier involved in the accident (Tr. 60-61, Exh. R-47). After examining the documents he said none of them made mention of front and right side mirrors as being either standard or optional equipment.

When cross-examined about abatement, Glowatz said that he was told by some of Respondent's employees that mirrors

placed on the 260 carrier would be knocked off because the carrier worked close to other yard equipment (Tr. 66).

Glowatz further testified that he did not know exactly where the mirrors should be placed (Tr. 69, 85) but thought he would generally follow the Clark Equipment Company's specifications (Tr. 69, Exh. C-23). He also suggested that Respondent do an engineering study (Tr. 77). He was unable to say how effective the mirrors would be in reducing the blind spot on the right side and front of the 260 carrier (Tr. 70, 83, 86). He thought that if a man were to stand eight feet away from the 260 carrier, parts of his body probably could not be seen (Tr. 72).

He acknowledged that in his report of investigation he noted that even if the straddle carrier was equipped with mirrors it was questionable if the operator could have stopped in time (Tr. 74). He had no information about where the carrier was when Smith walked from between the railroad cars (Tr. 87).

Testimony of William Rohbach

It was stipulated that if called he would testify that he is a crane operator in 25 run. He observed Smith uncouple a railroad car and throw blocking under the wheel, start to walk, take about three steps and be hit by the 260 carrier. He saw Smith put his hands up.

He would further testify that Smith's feet must have been

hit first and that the 260 carrier operator did not know Smith had been knocked over and drove over him (Tr. 88-89).

Testimony of Ronald Deutsch

It was stipulated that if called he would testify that he is a crane operator for Respondent. He observed Smith uncouple the railroad car and throw blocks to keep it from drifting.

The locomotive moved away and Smith turned and walked about two or three steps. Smith was then hit by the right front side, the blind side, of the 260 carrier.

It was going about 20 or 30 feet and was barely moving.

After the collision, Smith was knocked down, the 260 carrier ran over him. He was hit by the carrier's front tires, the shoes and the rear tire. Deutsch did not see the rear tire. He saw only the front tire and the shoes hit Smith (Tr. 90).

Testimony of Herbert Nicholas

He has been a carrier operator at the Respondent's plant for the past 19 years and was operating the 260 carrier when the accident occurred. He described the happening as follows.

> Q Where were you working on tne 22nd of November of 1978?
>
> A I was working -- I had just gone outside of 25 run, I do not remember what road, to pick up a lift for this truck in 25 run. I was coming into 25 run. I put the lift down and backed off and it had happened (Tr. 97).

* * *

Q All right, you had put the lift down and you had gone where?

A I put the lift down on the tracks aside of the truck and then I backed off. Then I saw an engine coming down, it was Track 512. I saw an engine come down and I was going to go in and pick the lift up so the engine could get out. This crane operator on 25 run started hollering. I did not know I had hit the guy. I would have run right over him again (Tr. 98).

He denied seeing Smith prior to the accident (Tr. 100).

When asked about his field of vision from the 260 carrier's cab Nicholas said he could look forward but could see nothing on the ground. He could see to the left just outside of the cab on the driver's side but could not see to the rear unless he turned around (Tr. 103). There were no mirrors on the right side to help his vision and doubted that he could see a six foot tall person who was standing within a foot or two of the 260 carrier's right side. Neither could such a person standing at the right front fender be seen from the cab (Tr. 104). He found the field of vision from the cabs of the smaller carriers to be limited but to a lesser degree than the 260 carrier (Tr. 105).

When asked for suggestions on how to overcome the visibility limitations Nicholas answered:

Q If mirrors were to be placed on the 260 straddle carrier where should they be placed in order to give you visibility on the right-hand side?

A I am taking orders when I drove it Wednesday, drove the 260, and they had a bracket up front.

Q They had a what up front?

A Right front corner where it had mirrors on before but they have gotten torn off, but then you can only see out along the side. I do not know where you would put a mirror where you can see down along the carrier.

Q Did you say that you could see along the right side with a mirror if it was placed on the front?

A Yes, out along the carrier, but I do not think you would be able to see down on the front. It would get knocked off too quick along the cars.

Q With the mirror that you did mention, you would be able to see along the right side?

A That is along the right side, but not down on the ground (Tr. 106).

Nicholas concluded his direct testimony saying that the roadway in the area was used by different types of vehicles and that about 68 employees worked there (Tr. 107).

In response to questioning on cross-examination and at times referring to the diagram (Exh. R-1) Nicholas said he had placed the 260 carrier about 20 feet away from the load that

he decided to remove from the area of the track 512 (Tr. 115). From that distance he could not have seen Smith (Tr. 118, 125, 128) because of the height of the 260 carrier (Tr. 127). However, he believed if a man was standing 25 feet away from the 260 carrier the top of his head could be seen. But a man five or ten feet away would not be visible (Tr. 128-129).

Nicholas further testified that he has not operated a 260 carrier or its duplicate 261 carrier that was equipped with mirrors (Tr. 125).

Testimony of Julius Mihala

He has been operating various models of straddle carriers for Respondent for the past 15 years. He described the 25 run, where the accident happened, as an area of much vehicular traffic and many pedestrian employees (Tr. 130-133).

When operating the 260 carrier involved in the accident or the 261 carrier he finds it difficult to see any person or object that may be close to the right side. He has no way of knowing if a person is there (Tr. 134). He experiences the same visibility limitations when operating Respondent's other Hyster carriers which are about one foot lower (Tr. 137). Some of the lower carriers have mirrors set back on the hood and they permit some vision far back of the carrier's right rear (Tr. 139).

Mihala thought that a convex mirror attached to the right front could increase the right side visibility to the ground.

However, it had to be positioned to avoid being knocked off (Tr. 141).

On cross-examination, Mihala testified that he did not know to what extent the use of a convex mirror would reduce the blind area on the right side of the 260 carrier (Tr. 143-144).

Testimony of Howard Miller

He has been operating straddle carriers for Respondent for about 20 years. He has operated the 260 carrier and is aware of the operator's limited visibility along the entire right side (Tr. 159-160). Prior to and after the accident, he discussed the visibility problem occasionally with his foreman Donald Cooper and suggested putting mirrors on the hood of the 260 carrier (Tr. 160-161). Respondent's Hyster carrier, Nos. 269, 304 and 305, are lower than the 260 carrier, and have convex mirrors on the hood (Tr. 162). They gave the operator greater visibility to the rear only (Tr. 166). After the accident everyone had suggestions. His was to place a mirror on the 260 carrier's hood on an arm that would be about one or two feet out from the side (Tr. 167-168).

When cross-examined, Miller changed his testimony by answering that he spoke to his foreman only once before the accident and that was a long time ago (Tr. 163). He further testified that the mirror on the hood of the 269 carrier only increased the visibility to the rear (Tr. 164). He agreed

with the testimony of other witnesses that a mirror extending beyond the side of the carrier would be knocked off because of the close working conditions (Tr. 165, 170-171).

Testimony of William K. Schellhaas
Respondent's Safety and Health Coordinator

He testified that it is his responsibility to be alert to any hazardous or potentially hazardous conditions at the plant (Tr. 184). From his observations and the fact that (1) during the 25 years Respondent has used carriers no other accident occurred in which a carrier struck an employee and (2) that in 1978, Respondent's carriers traveled 432,000 miles within the plant, he concluded that there was neither a 260 carrier visibility problem nor a recognized hazard associated with its use. However, he realized that there is an area around the 260 carrier where there is limited visibility which he equated to conditions prevailing in passanger cars (Tr. 254). The operator's field of vision from the 261 carrier cab (260 and 261 are identical) was quite good. An operator could see a person approaching from the 260 carrier's right front. However, the operator would lose sight of the person once he got very close, within several feet, of the 260 carrier's right side (Tr. 255).

Schellhaas was critical of the abatement methods suggested by the Secretary's witnesses, Mihala, Miller and Nicholas.

He stated that if mirrors were placed outboard they would be knocked off because of the close work. Mirrors placed inboard would only increase the operator's vision to the rear. It would also create a greater hazard because in order to use it the operator would have to divert his attention from the road and the load (Tr. 257-260, 280).

He tested the right side visibility of a carrier by holding a 14-inch convex mirror at the various places suggested by the Secretary's witnesses (Tr. 263-264). The mirrors positioned inboard and outboard did not improve the critical area of visibility close to the carrier (Tr. 319-320).

Schellhaas further stated that the mirror bracket on the 260 carrier mentioned by Nicholas[5] was mounted inboard and was used to hold a small convex mirror. Its function was to enable the operator to see the position of the load directly below the carrier (Tr. 264-265). He recalled that between 1950 and 1960, Respondent purchased 19 or 20 carriers, four or five more between 1972 and 1974 (Tr. 278) and that none of them were equipped with mirrors as the Secretary suggests (Tr. 279).

Schellhaas also testified that the probability of an accident occurring was not high. He based that on the Respondent's record of almost 26 years of operation of carriers traveling hundreds of thousands in plant miles without a prior pedestrian accident (Tr. 280).

---

5 At Tr. 106.

He explained that the Respondent's safety committee members are representives of unions, and members of Respondent's central safety department at the plant. His examination of the monthly meetings held from 1975 to date showed no reference to any complaints concerning visibility problems on carriers (Tr. 281). He concluded his direct testimony saying Respondent uses a number of safety measures in the yard including careful orientation of new employees to make them aware that there can be some potential danger while they are working in the vicinity of straddle carriers and the other mobile equipment in the yard (Tr. 282-283).

When cross-examined, Schellhaas said that he and Joseph Egan, Respondent's senior safety engineer, did not use either the 260 or 261 Hyster carriers when they did the mirror placement test. They used a smaller Hyster, about 12 inches lower, that was undergoing repairs in the shop. Throughout the test, various photographs were taken (Exhs. R-34 through 43) but no written report was prepared (Tr. 289-290).

He further testified that the investigation report[6] of the accident makes no reference to Smith not looking to the right or left (Tr. 318).

---

6 Identified as Respondent's "2533 reports".

Testimony of David A. Pike
Assistant General Foreman

He started working in Respondent's shipping yards in 1956. From 1967 through 1969, he operated the 260 and 261 Hyster carriers. At the time they were fairly new. He has neither seen any straddle carrier come from the manufacturer equipped with side mirrors like those proposed by the Occupational Safety and Health Administration (OSHA) nor was he aware of any recommendations by the manufacturer to add mirrors. Based on his experience, the operation of straddle carriers without mirrors is not viewed as a recognized hazard (Tr. 324). He never complained about the visibility on the carrier's right side or the lack of mirrors (Tr. 324-325).

He has damaged the carrier while operating it close to railroad cars and moving in areas with columns and trucks. The close work would cause outboard mirrors to be knocked off (Tr. 325-326).

In his opinion, the suggestions made by Mihala and Miller about the placing of mirrors inboard and outboard are neither feasible nor effective. Mirrors placed outboard would be knocked off. Mirrors placed outboard or inboard will not increase the right side field of vision (Tr. 327-328).

He said there was a very good field of vision from the cab of a 260 carrier. The operator could see a man or another vehicle coming towards it. He also felt that it would be

difficult for anything coming towards the 260 carrier to get so close that the operator could not see it but there are times that the operator would not see it quickly (Tr. 328).

In reply to questions on cross-examination Pike answered that a person, about six feet tall, approaching the carrier from its right front side would not be visible to the operator when that person was four or five feet from the carrier (Tr. 331); that carrier vibration would make the outboard mirror ineffective (Tr. 333-334); that he did not believe an inboard mirror even when adjusted to various angles, would enhance the right side visibility (Tr. 334).

Testimony of Joseph P. Eagan
Senior Corporate Safety Corporate Safety Engineer

Referring to various photographs taken from the carrier's cab (Exhs. R-34 through R-43) during the test done by him and Schellhaas, Eagan testified substantially as follows:

The test was conducted by having a supervisor hold a 14-inch convex mirror inboard and, measured from its bottom, two feet above the carrier's frame as shown in Exhibit R-42. From time to time Eagan would move to different points along the carrier's right side and the mirror would be tilted to different angles (Tr. 350-351).

He could not be seen in the mirror when standing at the carrier's right side 18 inches forward of the front fender (Tr. 345, Exh. R-34). When he moved back 18 inches, only the

top of his hard hat could be seen (Tr. 347-348, Exh. R-35). Moving to different positions from that distance of 18 inches he could not be seen (Tr. 352, Exh. R-36).

Exhibit R-37 shows his image in the mirror. At the time he was about four feet from the carrier's side (Tr. 352). When he moved in closer than four feet his image was lost (Tr. 352, Exh. R-38). His image appeared when he again stood about four feet from the side but further back than where he stood in Exhibit R-37 (Tr. 352-353, Exh. R-39).

Exhibit R-41 shows the mirror in the outboard position 20 inches out and two feet above the deck of the carrier (Tr. 353). In Exhibit R-43 the mirror is being held at the right rear where, according to Eagan, there was no place to mount it. Even if it could be mounted there, it would be of no value since it showed nothing along the right side and required the operator to turn around fully to look at it (Tr. 354).

Eagan further testified that the test showed the placement of mirrors as suggested by the Secretary's witnesses Glowatz, Nicholas and Miller would not abate the condition (Tr. 356-359).

Based on his investigation, and in his opinion, the operation of the carrier was not a recognized hazard. His investigation included examining the manufacturers' specification sheets for the Clark 60,000 lb. carrier Series 121, the Gerlinger 60,000 lb. carrier and for the Hyster 60,000 lb. 260 carrier involved in the accident. None of the literature

stated that side view mirrors were standard or optional equipment (Tr. 360-365, Exhs. R-45, R-46, R-47).

When questioned by the Secretary's counsel, Eagan said that about five months ago he saw the new Clark straddle carriers used at the Sparrows Point shipbuilding plant. They had mirrors on all four corners as standard equipment. He noticed that the mirrors were severely damaged and broken (Tr. 396).

In Exhibit R-35, which shows the top of his hard hat, the mirror was positioned to reflect the wheel area where Smith came in contact with the 260 carrier (Tr. 398).

On re-direct Eagan stated that the use of mirrors would neither improve the carrier operator's visibility on the right side nor improve the safe operation of the vehicle (Tr. 402). The new Clark carriers that he referred to were probably purchased by Respondent in 1975 or 1976 (Tr. 403).

## DISCUSSION

Respondent was cited for violating section 5(a)(1) of the Act because it allowed its employees to operate Hyster Straddle Carrier 260 which, it is alleged, did not have adequate vision from the operator's cab to the front and right side.

We consider first Respondent's contention that section 5 (a)(1) is not applicable because there is a standard which covers the areas of safety for straddle carriers that are raised in the

citation. The specific standard referred to by Respondent, 29 CFR 1910.178, is entitled Powered Industrial Trucks. It comprises numerous subsections relating to the operation, safety, design and construction of the vehicles. Subpart 2 incorporates by reference the "American National Standard for Powered Industrial Trucks, Part II, ANSI B56.1 - 1969."[7]

The Secretary argues that since 29 CFR 1910.178 and the referenced ANSI standard cover a large variety of vehicles, they have to be general and address those hazards which are common to the majority. Therefore, it is not comprehensive in scope.[8]

It is a well settled law that if any specific safety standard is applicable to the conduct at issue, a citation under the general duty clause of the Act will not lie. Secretary v. Sun Shipbuilding Company, 4 OSAHRC 1020 (1973).

A reading of the standard 29 CFR 1910.178 and the referenced ANSI standard shows that it relates to powered industrial trucks of various fork lift types which are graphically shown (Exh. R-48 App. A. p. 49-52) to be different in design and size from the 260 carrier.

The term Powered Industrial Truck, as used in the standard is defined as: "A mobile, power-driven vehicle used to carry, push, pull, lift, stack, or tier material."[9]

---

7 Respondent's Brief p. 30-32.

8 Secretary's Brief p. 11-12.

9 Exh. R-48, App. A. p. 48.

The type of straddle vehicle which the framers of the standard intended that it covers is defined as:

> STRADDLE TRUCK: A general class of cantilever truck with horizontal, structural wheel-suppported members extending forward from the main body of the truck, generally high-lift, for picking up and hauling loads between its outrigger arms. (Fig. 10)[10]

The numerous photographs of straddle carriers placed in evidence show that it is a massive four-wheeled vehicle that carries loads of materials beneath its elevated frame. It neither bears any resemblence in size, design nor operating function to the powered industrial trucks covered by 29 CFR 1910.178.

The Respondent relies upon Secretary v. Ingalls Shipbuilding Division, No. 76-900 (5/1977) and Secretary v. The Anderson Company, 2 BNA OSHC 3024. Both decisions are final orders of the Commission. Although such decisions may be persuasive they are not binding Commission precedent. Secretary v. Leone Construction Company, 3 BNA OSHC 1979, appeal withdrawn, No. 76-4070 (2nd Cir. 5/17/76). The standard is inapplicable.

In order to establish a violation of section 5(a)(1) the Secretary must prove:

(1) that the employer failed to render its workplace "free" of a hazard which was

(2) "recognized" and

(3) causing or likely to cause death or serious physical harm.

---

[10] Exh. R-48, App. A. Figure 10 at p. 52.

National Realty & Constr. Co., Inc. v. O.S.H.R.C., 489 F.2d 1257, 1265 (D.C. Cir. 1973); Cormier Well Service, 4 BNA OSHC 1085, 1975-76 CCH OSHD para. 20,583 (No. 8123, 1976). The Secretary must also demonstrate that there were feasible steps that the employer could have taken to avoid citation. National Realty & Constr. Co., Inc., v. O.S.H.R.C., supra at 1268; Cormier Well Service, supra.

To meet his burdern of proof,[11] the Secretary must prove by a preponderance of the evidence the existence of a serious hazard, Secretary v. A. E. Burgess Leather Co., Inc., 5 BNA OSHC 1096 (No. 12507, 1977), aff'd 576 F.2d 948 (1st Cir., 1978), It is established law that just as the existence of a violation need not result in an accident neither does the mere fact that an accident happened prove that a violation existed. National Realty & Constr. Co., Inc. v. O.S.H.R.C., supra; Secretary v. Hanovia Lamp Division (Conrad Precision Industries), reversed and remanded on other grounds, 502 F.2d 946, 949 (3rd Cir., 1974). However, the occurrence of and the circumstances surrounding an accident may be probative evidence of a violation. Secretary v. Ralston Purina Company, 7 BNA OSHC 1302 (No. 76-2551 RC).

The 260 carrier is a massive industrial vehicle that weighs 60,000 lbs. It is operated from a cab that is more than eight feet above the roadways it traverses. The structural steel yard where it is used is well-travelled by Respondent's pedestrian

---

11 Commission Rule 73(a).

employees and by various other powered industrial vehicles. There is unanimous testimony by four of Respondent's carrier operators that when operating a 260 carrier they have a limited area of visibility along the right side. Compliance Officer Glowatz experienced the same limited visibility. Furthermore, Respondent concedes there is limited visibility in a four or five feet area along the right side of the carrier.[12]

The evidence demonstrates that the operation of the 260 carrier without mirrors which would increase the operator's field of vision on the front and right sides of the 260 carrier constitutes a hazard. To hold otherwise would require the capacity to ignore the obvious.

Respondent's contention that no hazard exists with respect to the areas of limited visibility except in circumstances where an employee imprudently exposes himself to the blind spot[13] is without merit. The very absence of visibility associated with the operation of the 260 carrier under the facts and circumstances is an inherent hazard.

A serious violation exists when there is a substantial probability that death or serious physical harm could result if an accident occurs. Secretary v. Gaetano Construction Corp., 6 BNA OSHC 1463 (No. 14,886 RC, 1978). It undisputed that a fatality occurred.

---

12 Respondent's brief p. 36.

13 Respondent's brief p. 37.

The next question posed is whether or not the operation of the 260 carrier without adequate vision along its front and right sides constitutes a "recognized hazard" within the meaning of section 5(a)(1) of the Act. The Appelate Courts have held that to constitute a recognized hazard, the dangerous potential of a condition or activity must be known to the particular employer or generally in the industry. Brennan v. The Review Commission and Vy Lactos Laboratories, 494 F.2d 460, 463-464 (8th Cir. 1974); National Realty and Construction Co., Inc., v. O.S.H.R.C., 489 F.2d 1257, 1265 M.32.

As indicated elsewhere in this opinion, Respondent concedes that the 260 carrier has an area of limited visibility along right and front sides. As part of its safety program Respondent alerts its new employees to the "potential danger" while working close to the carriers (Tr. 282-283). Respondent's OSHA coordinator at the plant testified that he was aware of the limited visibility area but denies it was recognized.

The flaw in Respondent's denial of actual knowledge is that it equates a work area that has a potential hazard with one that is free of a hazard. Put another way, Respondent argues that a hazard does not exist unless an accident occurs to an employee and that the Secretary must prove the presence of an actual hazard. Respondent's argument flies in face of the purposes of the Act. The National Realty Court, supra.,

489 F.2d at 1265 N.33 held. "The keystone of the Act . . . is preventability," . . . for the Act is intended to protect against "possible hazards" and "potential hazards." accord. Usery v. Marquette Cement Mfg., Co., 568 F.2d 902.

Here the hazard was apparent to all of Respondent's employees and to the Respondent. Furthermore it scarcely requires any speculation or expertise to recognize that it is hazardous to operate a 60,000 lb. massive straddle carrier, whose operator has limited vision on one side, in an area where there are concededly pedestrian employees.

The Secretary has established that Respondent had the requisite knowledge. We need not therefore address the question of industry recognition.

As noted previously in this opinion, the Secretary must also establish the existence of feasible means the Respondent could have employed to abate the hazard and, therefore avoid being cited. The Secretary maintains that it was possible for the Respondent to install convex mirrors placed on the perimeter of the 260 carrier on the right rear and left front. The abatement measure offered by the Secretary was not the result of any tests done by the Secretary but rather they were based upon speculation and surmise. While it was suggested that the mirrors be placed on the 260 carrier as done by another manufacturer, the Secretary's main witness conceded that the

effectiveness of the mirrors to reduce the hazardous condition was an unknown quantity. He expressed uncertainty about the benefits of using the mirrors that he suggested.

The reservations and doubts that taint the Secretary's case are forcefully supported by the mirror placement test conducted on a carrier only one foot lower than the 260 carrier by Respondent's plant OSHA coordinator and its expert safety engineer.

It is not foreign to the issue that the Secretary's witnesses as well as the Respondent's agreed that mirrors installed to any extent outboard of the 260 carrier would be knocked off, damaged beyond use or otherwise rendered useless as a result of working in close quarters. It was undisputed by the Secretary that mirrors placed outboard on carriers, similar to the 260 carrier, that were used in another of Respondent's workplaces were damaged and rendered useless.

The court in the National Realty case in addressing the question of abatement at the conclusion of its opinion held:

> To assure that citations issue only upon careful deliberation, the Secretary must be constrained to specify the particular steps a cited employer should have taken to avoid citation, and to demonstrate the feasibility and likely utility of those measures.

Considered within the framework of that ruling the Secretary did not carry his burden of proof that Respondent violated

the general duty clause.

Had the Secretary established that Respondent was in violation of the general duty clause nevertheless the Respondent's "isolated incident" or "unpreventability" affirmative defense would be sustained.

The evidence proves that Respondent has a comprehensive safety program. The employees in the structural steel yard receive adequate training and instructions designed to prevent accidents, particularly those involving the powered industrial trucks utilized in the area. The occurrance of a single accident involving carriers in 25 years underscores the effectiveness of the program and is indicative of its enforcement.

Under the facts and circumstances present in this case it is reasonable to conclude that the unfortunate accident was an isolated incident that resulted from an employee's departure from an effectively enforced work rule. Secretary v. B. G. Maintenance Management, Inc., 4 BNA OSHC 1282; National Realty and Construction Co., Inc., v. O.S.H.R.C. and Secretary of Labor, supra.

Having heard the testimony of the witnesses and having observed their demeanor, it is concluded that the following findings of fact are supported by a preponderance of the credible evidence.

## FINDINGS OF FACT

1. The field of visibility from the 260 carrier operator's cab is limited along the carrier's front and right sides.

2. The hazard is inherent in the operation of the 260 carrier and is apparent.

3. The operation of the 260 carrier without mirrors which would increase the operator's field of vision from the cab constitutes a hazard at Respondent's workplace.

4. Respondent had knowledge of the hazard.

5. The Secretary's evidence does not prove the feasibility and likely utility of the use of mirrors to increase the field of visibility along the 260 carrier's front and right sides.

6. The Respondent has a safety program that is effectively and uniformly enforced.

7. Calvin Smith's fatal accident was an isolated incident that resulted from his departure from the work rule.

## CONCLUSIONS OF LAW

1. The Respondent is, and at all times material hereto was, engaged in a business affecting commerce within the meaning of section 3(5) of the Occupational Safety and Health Act of 1970.

2. The Respondent is, and at all times material hereto, was subject to the requirements of the Occupational Safety and Health Act and the standards promulgated thereunder and the Commission

has jurisdiction of the parties and of the subject matter herein.

3. Respondent was not in violation of section 5(a)(1) of the Act (29 U.S.C. 654(a)(1)).

Accordingly, it is ORDERED that:

The citation alleging a serious violation of section 5(a)(1) of the Act 29 U.S.C. 654(a)(1), and the penalty proposed therefore be vacated.

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

A decision of Administrative Law Judge J. Paul Brenton is before the Commission pursuant to section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). Judge Brenton vacated a citation alleging that Respondent, United Cotton Goods, Inc., violated the Act by failing to comply with the personal protective equipment standard at 29 C.F.R. § 1910.132(a).[1/] Also, at the

---

1/ 29 C.F.R. § 1910.132(a) provides:

Subpart I — Personal Protective Equipment

§ 1910.132 General requirements.

(a) Application. Protective equipment, including personal protective equipment for eyes, face, head, and extremities, protective clothing, respiratory devices, and protective shields and barriers, shall be provided, used, and maintained in a sanitary and reliable condition wherever it is necessary by reason of hazards of processes or environment, chemical hazards, radiological hazards, or mechanical irritants encountered in a manner capable of causing injury or impairment in the function of any part of the body through absorption, inhalation or physical contact.

hearing, Judge Brenton denied a motion by the Secretary of Labor ("the Secretary") to amend the citation to allege, in the alternative, noncompliance with the machine guarding standard at 29 C.F.R. § 1910.212(a)(3)(ii).[2/] The Secretary filed a petition for discretionary review which Commissioner Cleary granted. For the reasons that follow, we reverse the judge's ruling on the Secretary's motion to amend and we remand for further proceedings.

Respondent manufactures linen supplies at its plant in Griffin, Georgia. Respondent's employees use electric knives to cut through stacks of material. The plant was inspected on May 25, 1977 and on June 2, 1977 the Secretary issued a citation alleging that Respondent failed to comply with section 1910.132(a) in the following manner:

> Protective equipment was not used where it was necessary by reason of hazards encountered in a manner capable of causing injury or impairment in the function of any part of the body:
>
> Cutting Room - metal mesh gloves were not worn by employees during fabric cutting operations.

---

2/ 29 C.F.R. § 1910.212(a)(3)(ii) provides:

Subpart O -- Machinery and Machine Guarding

* * *

§ 1910.212 General requirements for all machines.

(a) Machine guarding—

* * *

(3) Point of operation guarding.

* * *

(ii) The point of operation of machines whose operation exposes an employee to injury, shall be guarded. The guarding device shall be in conformity with any appropriate standards therefor, or, in the absence of applicable specific standards, shall be so designed and constructed as to prevent the operator from having any part of his body in the danger zone during the operating cycle.

Thirteen days before the hearing on November 10, 1977,[3/] the Secretary moved to amend the citation to add the following charge of noncompliance with 29 C.F.R. § 1910.212(a)(3)(ii):

> [R]espondent failed effectively to guard the point of operation of fabric cutting knives in its cutting room with a guard so designed and constructed as to prevent an exposed employee from having any part of his body in the danger zone during the operating cycle.

By order dated November 7, 1977, Judge Brenton denied the Secretary's motion as being "too late."

In Brown & Root, Inc., Power Plant Division, 80 OSAHRC 17/B8, 8 BNA OSHC 1055, 1980 CCH OSHD ¶ 24,275 (No. 76-3942, 1980) ("Brown & Root"), the Commission upheld an amendment first presented by the Secretary six days before the hearing. The Commission stated that, under Rule 15(a) of the Federal Rules of Civil Procedure,[4/] "prehearing amendments should be granted as long as the objecting party would not be prejudiced in the preparation and presentation of its case" and that "amendments well before the hearing rarely result in any prejudice." 8 BNA OSHC at 1058-59, 1980 CCH OSHD at p. 29,569.[5/] Because the original and amended charges arose out of the same conduct or occurrence, the Commission concluded that the Secretary's claim remained unchanged and therefore that the amendment was not prejudicial. The Commission further held that any prejudice that may have arisen in that case,

---

3/ The hearing had been postponed twice at the Secretary's request.

4/ Unless the Commission adopts a different rule, its proceedings are governed by the Federal Rules of Civil Procedure. Section 12(g), 29 U.S.C. § 661(f).

5/ The Commission has consistently allowed amendments to citations under Federal Rule of Civil Procedure 15(a). See, e.g., Miller Brewing Co., 80 OSAHRC 5/A2, 7 BNA OSHC 2155, 1980 CCH OSHD ¶ 24,168 (No. 78-3216, 1980); P.A.F. Equipment Co., 79 OSAHRC 18/A2, 7 BNA OSHC 1209, 1979 CCH OSHD ¶ 23,421 (No. 14315, 1979), aff'd, 637 F.2d 741 (10th Cir. 1980); Constructura Maza, Inc., 78 OSAHRC 6/E2, 6 BNA OSHC 1309, 1977-78 CCH OSHD ¶ 22,487 (No. 14509, 1978).

because the original and amended charges required different abatement methods, could have been cured by a continuance. The Commission noted that, because the amendment was presented prior to the hearing, Respondent had an adequate opportunity to determine whether a continuance would be necessary to prepare defenses to the amended charge. The Secretary's delay in presenting the amendment was rejected as a basis for denying the prehearing amendment. 8 BNA OSHC 1059, 1980 CCH OSHD at p. 29,569, and cases cited therein.

In this case, one condition, exposure to injury at the points of operation of fabric cutting knives, is the basis of both charges. Accordingly, the Secretary's claim remained unchanged. As in Brown & Root, the amendment in this case changed the abatement method — from metal mesh gloves to point of operation guarding — and this change affected Respondent's defenses, such as impossibility of compliance or greater hazard. See Frank Swidzinski Co., 81 OSAHRC 4/E14, 9 BNA OSHC 1230, 1981 CCH OSHD ¶ 25,129 (No. 76-4627, 1981); Duncanson-Harrelson Co., 81 OSAHRC 28/A2, 9 BNA OSHC 1539, 1981 CCH OSHD ¶ 25,296 (No. 76-1567, 1981). However, as Brown & Root indicates, a continuance could have been employed to cure any possible prejudice. Accordingly, we grant the amendment and remand the case to the judge for further proceedings so that the parties may try the amended charge.[6/] SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

RAY H. DARLING, JR.
EXECUTIVE SECRETARY

DATED: FEB 23 1982

---

6/ In Commissioner Cleary's view, the parties should consider whether this alleged violation should be characterized as de minimis. See Fabricraft, Inc., 79 OSAHRC 49/A2, 7 BNA OSHC 1540, 1979 CCH OSHD ¶ 23,691, (No. 76-1410, 1979); Hood Sailmakers, Inc., 77 OSAHRC 212/C12, 6 BNA OSHC 1206, 1977 CCH OSHD ¶ 22,422 (No. 13996, 1977).

ROWLAND, Chairman, dissenting:

I dissent from the majority's decision to amend the citation so as to allege noncompliance with section 1910.212(a)(3)(ii). I would affirm Judge Brenton because in my view he did not abuse his discretion in denying the amendment. I do not reach the question of whether Judge Brenton erred in vacating the alleged violation of section 1910.132(a), the standard originally cited.

Leave to amend under Rule 15(a) is within the discretion of the trial judge, and may be denied for undue and unjustified delay where the movant had sufficient prior opportunity to amend. Zenith Radio Corp. v. Hazeltine Research, Inc., 401 U.S. 321 (1971) (discretion); Forman v. Davis, 371 U.S. 178 (1962) (discretion, undue delay); Frank Briscoe Co., 76 OSAHRC 129/A2, 4 BNA OSHC 1729, 1976-77, CCH OSHC ¶ 21,162 (No. 7792, 1976) (undue and unexcused delay).

Although this case had been pending for over five months, the Secretary did not move to amend until less than two weeks before trial. During the preceding months, the Secretary filed with the judge two motions for a continuance, a settlement conference report, and a response to a motion to strike; yet the Secretary did not request leave to amend in any of his prior correspondence with the judge. In this regard, I note that the discussions of the case during the settlement negotiations should have alerted the Secretary to the potential section 1910.212(a)(3)(ii) charge. Moreover, when the Secretary eventually sought an amendment shortly before trial, he gave no explanation for his delay. In light of the Secretary's unexplained delay in requesting an amendment despite prior opportunity to do so, I conclude that Judge Brenton did not abuse his discretion in denying the amendment.

Inasmuch as the majority amends the citation and remands the case for further proceedings on the amended charge, I need not at this time consider whether the judge erred in his disposition of the originally alleged violation of section 1910.132(a). Accordingly, I do not now express an opinion as to the merits of the section 1910.132(a) allegation.

## DECISION AND ORDER

APPEARANCES

Ken S. Welsch, Esquire, Office of the Solicitor, U. S. Department of Labor, Atlanta, Georgia, on behalf of complainant

Fred M. Richardson and E. Bruce Mather, Esquires, Atlanta, Georgia, on behalf of respondent

Brenton, Judge

## STATEMENT OF THE CASE

On June 2, 1977, complainant issued to respondent a citation, pursuant to the provisions of the Occupational Safety and Health Act of 1970 ("Act"), charging violations of § 5(a)(2) of that Act. That action followed a May 25, 1977, inspection of respondent's cut/sew industrial workplace in Griffin, Georgia, by complainant.

Respondent contests item 1 of citation 1 and its correlative proposed $360.00 penalty.

Respondent's answer to the complaint concedes it is engaged in a business affecting commerce.

This case was heard in Atlanta, Georgia, on November 10, 1977.

## THE CHARGE

The citation describes the contested violation as follows:

> "29 CFR 1910.132(a): Protective equipment was not used where it was necessary by reason of hazards encountered in a manner capable of causing injury or impairment in the function of any part of the body:
>
> > Cutting Room - metal mesh gloves were not worn by employees during fabric cutting operations."

## THE STANDARD

29 CFR 1910.132(a) provides:

> "Protective equipment, including personal protective equipment for eyes, face, head, and extremities, protective clothing, respiratory devices, and protective shields and barriers, shall be provided, used, and maintained in a sanitary and reliable condition wherever it is necessary by reason of hazards of processes or environment, chemical hazards, radiological hazards, or mechanical irritants encountered in a manner capable of causing injury or impairment in the function of any part of the body through absorption, inhalation or physical contact."

The alleged violation was fashioned by complainant upon observation of the operations and practices employed by respondent in its cutting room where it cuts linen supplies, tablecloths, hospital gowns, sheets, scrub uniforms, and surgical wraps from materials of woven cotton and synthetic blends.

Eight cutters have access to and use seven electric Eastman Ultronic straight knives and two Eastman round knives[1/] in the cutting processes.

## WORKPLACE, KNIFE, AND OPERATIONS

The alleged violation occurred in the cutting room which is well lighted, equipped with four long tables, a spreader for stacking plies of cloth, racks of fabrics, overhead electric cables, the cutting knives, material handling equipment, and miscellaneous tools and equipment.

Each straight knife addressed to the citation has three moving parts, a blade, abrasive bands, and a pressure foot or guard. The electric motor and operating mechanisms are mounted on a perpendicular shaft which rises from a baseplate. The blade is confined within that shaft with its cutting edge exposed so it can perform its work. The abrasive bands are mounted at the top of the blade, connected with a worm gear or screw shaft and moves up and down along the sides of the blade at its cutting edge when activated for the purpose of sharpening the blade. A perpendicular bar or guardrod extended not more than one and one-half inches in front of the blade

---

1/ At the hearing, complainant withdrew any violation of 29 CFR 1910.132(a) as having any application to the Eastman round knives (Tr. 122).

is attached to the pressure foot and rises to the top of the knife where it is attached to a lever for manual lifting. The foot surrounds the blade, extends in front of the guardrod, and rises and falls around the blade (Ex. R-2). A trigger to the right of the operating handle controls the position and movement of the guard. When the trigger is not depressed, the guard is locked in its then position. When the knife is activated, the stroke of the blade is one and one-half inches perpendicularly.

The knife is manually controlled by the right hand from a horizontal operating handle located to the rear of the knife. All controls of the moving parts of the knife are located topside. An apron under and in front of the pressure foot or guard, an extension of the baseplate, rides on the surface of the table under the fabric during the cutting operation.

A cutting operation begins after a cutter has laid out the plies or layers of cloth to be cut on a table, cut out seams and defects, and marked out the required pattern or patterns.

A knife is then brought to the table. A drop cable with a female connector is engaged with the three prong male connector atop the knife and locked by the cutter. He then sharpens the blade by first activating it after securing the pressure foot or guard in the down position and then activating the sharpener which drives the abrasive bands down the full length of the blade and returns them. During these operations the right hand is on the operating handle and the left is atop the knife to depress the sharpening button and

attend the other operating levers and devices (Tr. 138-139).

Now with the guard in the down position the knife is moved, by the right hand on the operating handle and with the left hand he lifts the guard to a position high enough to allow the knife blade to enter the stack of cloth and then releases the guard causing it to fall onto the lay of cloth. The cutter then raises the lay with his left hand, pushes the knife with his right hand on the operating handle which places the apron of the knife under the lay. At that point the cutter proceeds with the cutting by moving and guiding the knife with his right hand on the operating handle with his left positioned on the lay of cloth in front of the guard or pressure foot to smooth out ripples and hold the fabric down. He may also use the left hand to straighten edges, re-sharpen the blade, and remove waste. Whenever the hands are removed from the knife, the action of the blade is switched off and the guard is in the down position. The left hand is usually out in front of the pressure foot or guard five to six inches and never closer than three inches on a few close cuts. The left hand moves in unison with the right and at the same speed. Upon the completion of the cutting of the patterns, the knife is disconnected from the electric cable and removed from the table (Tr. 140-145).

## THE HAZARD ALLEGED

At the time of the inspection of respondent's fabric cutting operations by complainant, the cutters were not wearing a thumb and

first two finger metal mesh glove nor was the point of operation of the blade of the knife completely enclosed. It is clear that had either form of alleged protection been afforded, the item of the citation at issue would not have been issued. (Complainant's brief p. 7). Because the blade is not completely enclosed by an undefined barrier guard, complainant contends there is some exposure to the action of the blade. In absence of a barrier, complainant would have the Review Commission mandate the metal mesh glove by authority of 29 CFR 1910.132(a).

The contention of the complainant is grounded on the proposition that by reason of the close proximity of the left hand to the blade as the cutter propels the knife through the mark of his pattern, the pressure foot or guard is insufficient to preclude accidental knicks and cuts. Complainant argues that a severe cut is possible if a cutter pushed his hand into the blade, but concedes that in respondent's operation the most likely injury is a minor nick or cut.

## ISSUES

Whether respondent was on notice by the commands of 29 CFR 1910.132(a) that its cutters were required to wear a metal mesh glove on the hand used to position and hold down the lays or plies of fabric during the cutting process.

Whether the utility of the metal mesh glove when worn by cutters in the cut/sew industry has been established.

Whether respondent's straight cut knives are machines and subject to a specific standard rather than the general cited standard.[2/]

DISCUSSION

This case is identical or almost identical with Fashion Industries, Inc., _____OSHRC_____, _____BNA OSHC _____, _____CCH-OSHD_____ ¶_____(No. 71-1027, 1977), recently heard and decided by this tribunal and unreviewed by the Review Commission. Upon the inception of the hearing, complainant conceded the identity (Tr. 4-5). It is on all fours with the facts and law as found and held in that case except, there, respondent had no injuries to its cutters, and here respondent experienced two and perhaps three minor injuries to cutters during operations in the year 1976. And, respondent's cutters each average about three hours each day in operating the knife and in Fashion Industries, Inc., supra, about 30 minutes each.

Thus, do those factual differences supply the missing links encountered in Fashion Industries, Inc., supra, to make a case that respondent was on notice that it was required to cause its cutters to wear metal mesh gloves.

Because respondent had two injuries in 1976 occurring during the cutting process, complainant argues at length that this factor

---

2/ This issue was not raised directly by respondent, however, it is an issue of law imposed by the undisputed facts.

is sufficient to put it on notice that the cited standard commands the use of metal mesh gloves by its cutters. He attempts to buttress that argument with the very method which must be used by respondent's cutters to cut the fabrics for uniforms and tablecloths.

There is no significant difference between the method or process used by respondent here and that by the employer in Fashion Industries, Inc., supra. Moreover, complainant ignores the Review Commission decision in Grand Union Co., 75 OSHRC 88/A2 (20/663), 3 BNA OSHC 1597, 1975-76 CCH-OSHD ¶ 20,107 (Nos. 7031 and 7033, 1975). There it held that 18 knife cuts, one of which was recordable under 29 CFR § 1904.12(c), over a period of a three and one-half year period, to meat department store employees did not establish a hazard of processes within the meaning of 29 CFR 1910.132(a), such as to put the employer on notice that such employees shall be provided and caused to use metal mesh gloves. Included in that determination was the fact that no other standard informed the employer of a metal mesh glove requirement for retail meat cutters, and the fact that there was no industry custom or practice commanding its use.

Respondent has not had any other injuries over the past seven years resulting at a time a knife was operational, and the two or three in evidence here have not been shown as recordable by complainant's standards. The evidence does show that no one of those resulted in any lost work time.

There is no evidence that any other standard informs respondent that it had a duty to require its cutters to wear metal mesh gloves (Tr. 120).

With respect to the use of metal mesh gloves by cutters in the cut/sew industry, respondent's manager, John McMillan, with 17 years experience in the cut/sew industry and having seen the operations of about 12 cut/sew plants had never seen nor heard of cutters wearing metal mesh gloves.

Complainant's compliance officer offered no testimony that the metal mesh glove was in use in the cutting room of any plant in the cut/sew industry. Complainant did produce evidence which shows that the cutters at Manhattan Shirt Company have been wearing the thumb and two finger metal mesh glove for the past two years as an equivalent means of guarding for violation of 29 CFR 1910.212(a)(3)(ii). On the other hand, John Schwartzott has visited 2,000 to 2,500 plants and has never seen the gloves used in any cutting room until beginning with the year 1974 where he observed about six out of two to three hundred where they were on hand as a result of an OSHA inspection but rarely used by the cutters unless an inspection was imminent. His testimony is considered reliable and trustworthy.

The preponderance of the substantial, reliable, probative, and relevant evidence shows conclusively that cutters in the cut/sew industry in any area or place do not universally wear metal mesh gloves except at Manhattan Shirt Company. But the exclusive cutting of dress shirts is a different operation. The cuts are mostly short

cuts requiring the cutter to place his thumb and index finger as close to the blade as the pressure foot will permit. And this is an eight-hour day operation.

Upon the record made in this case, Manhattan's experience with OSHA is an isolated case. All the evidence bearing on it simply and clearly shows that at the time of the inspection of respondent's cutting room, respondent had not received a reasonable warning of the proscribed conduct. The hazard alleged was not generally known in the cut/sew industry.

The utility of the metal mesh glove in respondent's operations is suspect. Complainant through his compliance officers admits that the utility of the metal mesh glove in the cut/sew industry was not tested in any respect, nor did he investigate industry practices prior to introducing the failure to use it as a violation under the personal protective provision of 29 CFR 1910.132(a) (Tr. 168 and 212-214).

Respondent and Mr. John Schwartzott, the latter, the only qualified expert to testify, made separate tests and used the glove under actual cutting operations. Those tests show that the blade can and did snatch the gloves and tear holes or cut through the glove. Further, that its use intrusively interferes with the operations such as the removal of waste, raising thick lays of cloth, the hanging up of the glove on the cloth as it is moved along on top in the cutting procedure, renders unto the cutter a false sense of security, and reduces his sense of touch. The witness from Manhattan Shirt Company agreed that indeed the glove does give a false sense of security and that

his cutting operations were different than those at respondents.

The parties agree that if any part of the operator's hand was under any part of the one and one-half inch stroke of the blade the metal mesh glove would be ineffective.

Also, it is noteworthy to observe that complainant had conducted a prior inspection which included respondent's cutting operation with the electric knife but failed to allege or discuss an unprotected hazard at that time (Ex. R-10). Also, that the knives are sold to and used by United States Government agencies, and their cutters are not required to use a metal mesh glove (Tr. 188-189).

Finally, the proposition that the wearing of the metal mesh glove during the operation of powered equipment, the constant problem of the glove becoming caught in the moving parts of the machine is presented. The evidence preponderantly indicates that the glove could jam and be caught up in the mechanism of the sharpening device. Also, the evidence demonstrates that the moving knife blade is particularly vulnerable in snatching the glove. In evidence is OSHA Program Directive, No. 100-49, in which the Secretary states that metal mesh gloves should not be used by meat cutters operating powered equipment (Ex. R-11).

Carlisle Bunn, complainant's technical support expert generated the memo which introduced the use of metal mesh gloves for guarding of cutting blade powered cutting knives in the cut/sew industry. He was on the witness stand and failed to demonstrate the distinction, if any, between the cutting blade powered cutting knives used

in the cut/sew industry and powered knives and machines used in the meat industry. It is obvious that in each case the knives are items of powered equipment and in the real world there is no distinction.

Respondent's knives are machines. And this fact was admitted by complainant through Mr. Carlisle Bunn. He testified:

> "[29 CFR 1910]212 is the basic paragraph for machine guarding from point of operation (Tr. 214)."

Moreover, he issued his personal protective equipment memo of September 4, 1975, upon an inquiry:

> "[T]hat the machines [electric knife cutters] are not adequately guarded, and that there was a necessity for some personal protective equipment in addition to the guard (Tr. 214)."

Section 1910.212 seeks to guard against the hazards created by point of operation and rotating parts among other matters. But it also provides that:

> "[T]he guard shall be such that it does not offer an accident hazard in itself."

By complainant's memo of September 4, 1975, he admits that respondent's knives are provided with a guard. But, because there is a gap between the blade and the guard he seeks to enclose it with a metal mesh glove. That kind of device will not prevent the operator from having any part of the covered or uncovered portion of the hand in the danger zone during the operating cycle. Moreover, the evidence demonstrates that although its use may prevent a minor nick or cut it could be the source of a very serious injury when used around and about the moving parts, particularly the rectilinearly and perpendicularly reciprocating blade, of the high powered knife cutting machine.

Furthermore, complainant's enforcement action of 29 CFR § 1910.132(a) upon the cut/sew industry is an unchartered course of conduct without any regard to the differences in the duties and processes employed among the many hundreds of cut/sew establishments.

The preponderance of the reliable, probative, and relevant evidence on the record as a whole shows, in light of common understanding and practices, that the mandate of 29 CFR 1910.132(a) failed to afford a reasonable warning of the proscribed conduct. Thus, respondent should not be held in violation of § 5(a)(2) of the Act as charged by the citation.

## FINDINGS OF FACT

1. Respondent's knives are electrically powered and equipped with a very fast moving blade. Also they are equipped with abrasive bands which move up and down the blade.

2. The pressure foot on each knife is designed, constructed, and used so as to prevent the operator from having his left hand in the danger zone, the point of operation, during the operating cycles of the blade.

3. Respondent neither provided for wearing nor required its cloth cutters to wear metal mesh gloves.

4. A thumb and two finger metal mesh glove will not prevent any part of the hand of the cutter from penetrating the gap between the pressure foot--guard and the blade.

5. The cut/sew industry does not have a custom nor a practice of supplying the operators of the electric powered knife with a thumb

and two finger metal mesh glove.

6. The metal mesh glove when worn offers an accident hazard itself. It can be snatched, pulled into, and be caught up with by the knife blade.

7. The action of the blade of the knife penetrates the metal mesh glove even when lightly encountering the blade.

8. Respondent employs eight cutters and, although there have been two and perhaps three nicks or cuts from its cutting operation with the knife over a seven-year period, none has been a lost-time accident or a recordable injury by complainant's standards as defined under 29 CFR 1904.12.

9. There is no evidence that there has ever been a recordable injury to any cutter in the cut/sew industry at any plant in the country during the cutting process, with an Eastman Ultronic straight knife, in the absence of a metal mesh glove on the hand.

## CONCLUSIONS OF LAW

1. The Review Commission has jurisdiction to hear and decide this case.

2. The wearing of metal mesh gloves by cutters in the cut/sew industry is not specifically mandated by any regulation promulgated under the Act.

3. It is apparently axiomatic that a prudent and reasonable man would not require a cutter in the cut/sew industry to wear a metal mesh glove where history in the industry shows no recordable injury under the standards promulgated therefor by the Secretary of Labor.

4. The utility of a metal mesh glove in respondent's cloth cutting operation has not been established.

5. Respondent did not have fair notice that its cutters must be provided with metal mesh gloves because the regulation, 29 CFR 1910.132(a), failed to provide constitutional adequate warning to respondent in light of the understanding and experience of those working in the industry that the wearing of a metal mesh glove is a reasonable requirement.

6. 29 CFR 1910.212(a)(3)(ii) is specifically applicable to the conditions and processes existing in the use of respondent's knives and by virtue of 29 CFR 1910.5 prevails over the different general standard alleged which might otherwise be applicable to the same conditions and processes.

7. Respondent did not violate § 5(a)(2) of the Act as alleged or charged and as tried on the record in this case.

8. Penalty considerations have been rendered moot.

## ORDER

It is ordered that:

Item 1 of citation 1 and its correlative proposed penalty be and each is, vacated.

So ordered.

APPEARANCES:

Lawrence J. Hallett, Jr., Esquire, Stout, Roebuck & Hallett, Mobile, Alabama, on behalf of the respondent.

Debra H. Green, Esquire, U. S. Department of Labor, Birmingham, Alabama, on behalf of the complainant.

## DECISION AND ORDER

Following an inspection of its work site in Mobile, Alabama, on May 8, 1981, Campbell Construction Engineers, Inc. (Campbell) was issued two citations pursuant to Section 9(a) of the Occupational Safety and Health Act of 1970 (29 U.S.C. 651, et seq., the "Act").

A hearing was held in Mobile, Alabama, on October 26 and 27, 1981. No affected employee or authorized employee representative elected to participate as a party.

Under Citation 1, Campbell was charged as follows:

"1A - 29 C.F.R. 1926.651(c)[1/]: The walls or faces of excavation(s) in which employee(s) were exposed to danger from moving ground were not guarded by a shoring system, sloping of the ground, or some other equivalent means:

(a) Along Highway 90 at Fairway Drive - excavation in wet soil, in which employees were required to enter was not shored or sloped.

"1B - 29 C.F.R. 1926.651(i)(1)[2/]: Excavated or other material was not effectively stored or retained at least 2 feet or more from the edge of the excavation(s) which employee(s) were required to enter:

(a) Excavation at Highway 90 and Fairway Drive - spoil was piled four feet high at the edge of the excavation."

The alleged violations are characterized as serious with a penalty of $420 proposed.

Citation 2 alleges nonserious violations with no penalty as follows:

"1A - 29 C.F.R. 1926.450(a)(2)[3/]: Ladder(s) discovered to be defective were not immediately withdrawn from service:

(a) In excavation, north wall - ladder had one split and broken rung and two bent rungs.

---

1/ This provides:

The walls and faces of all excavations in which employees are exposed to danger from moving ground shall be guarded by a shoring system, sloping of the ground, or some other equivalent means.

2/ This section states:

In excavations which employees may be required to enter, excavated or other material shall be effectively stored and retained at least 2 feet or more from the edge of the excavation.

3/ This section provides:

The use of ladders with broken or missing rungs or steps, broken or split side rails, or other faulty or defective construction is prohibited. When ladders with such defects are discovered, they shall be immediately withdrawn from service. Inspection of metal ladders shall include checking for corrosion of interiors of open end hollow rungs.

"1B - 29 C.F.R. 1926.450(a)(10)[4/]: Portable ladder(s) in use were not tied, blocked, or otherwise secured to prevent their being displaced:

(a) In excavation, north wall - ladder in use was not tied or blocked."

There is no issue as to jurisdiction in that respondent, in its answer, concedes it is an employer engaged in commerce within the meaning of the Act.

I.

According to the evidence, on May 7, 1981, Campbell was engaged in a pipe laying project at Highway 90 and Fairway Drive in Mobile, Alabama. On that day, Billy Layton, a compliance officer for the Secretary, inspected the jobsite and took a number of photographs introduced as exhibits (Exs. C-1-C-8). He observed three of respondent's employees standing and working in an excavation which he measured as being 42 feet long, 15 feet wide and 10 feet, 9 inches deep (Tr. 78-80, Exs. C-6, C-7).

Oyster shells were being placed in the bottom of the excavation in a four-inch deep layer. The ground underneath was soft white sand (Tr. 81-82). A backhoe was being operated at one end of the trench (Tr. 81). According to Mr. Layton, there was no shoring or sloping of the excavation (Tr. 82, 83). In the event of a collapse of the walls, the great pressure and the amount of soil would be such that workmen could be suffocated before rescue (Tr. 84).

Mr. Layton also observed earth piled approximately four feet high on the right edge of the excavation which was not placed at least two feet from the edges (Tr. 80, 85, 86, Ex. C-7).

---

4/ This section states:

Portable ladders in use shall be tied, blocked, or otherwise secured to prevent their being displaced.

During his inspection, Mr. Layton also observed a ladder in the excavation which had one broken rung and two bent rungs. It was also not tied or blocked off to prevent slipping (Tr. 92, 93, Ex. C-8).

Harvey N. Blakeney, a professional engineer, is chief of the Geotechnical and Materials Branch, Mobile District, Corps of Engineers. He has also been Chief of the Soil Design Section. On August 10, 1981, he conducted a soil sample test at the location of the excavation. He determined that the soil was composed of soft to moderately stiff fat clay down to the eight-foot level. From this level down to a depth of 9.8 feet, he found a mixture of this clay material mixed with oyster shells. Below this to a depth of 11 feet, he found fine and water bearing sand (Tr. 28, 29, Ex. C-4).

He found there had been movement of the soil since the auger went in and out of the virgin soil in its downward movement (Tr. 39, 40).

Mr. Blakeney took soil samples back to his office and tested them with a Pocket Pentrometer and a Torvane device. These tests enabled him to determine the shear strength of the soil and thus ascertain how much stress the soil could be subjected to without failure (Tr. 30, 31, C-5). In his opinion, the soil should fail under a vertical cut of 13.6 feet. Vibrations from machinery and nearby traffic could influence the failure point (Tr. 32, 33). Also, if this type of clay had been dry and then received a good rainfall of even four inches, water could penetrate tension tracks and increase stress (Tr. 34). He testified he would not have worked on the excavation without shoring, sloping or other equivalent means of protection (Tr. 35).

Ray H. Barnes, Meterologist in Charge, National Service Office, Mobile, testified as to the unusual weather conditions which existed in Mobile on May 5 and 6, 1981. Eight inches of rainfall were recorded at the Airport during that time (Tr. 7, 8). Other rain gauges in the area indicated up to 12 inches (Tr. 12, Exs. C-1 & C-2). He was unable to testify as to the amount of rainfall at the intersection of Highway 90 and Fairway Drive, since he did not know where the latter road was (Tr. 13). He conceded that the rainfall in the Mobile area was not uniform and that some outlying locations received only two inches or less (Tr. 18).

John R. Overturf testified he was President of Southern Safety and Environmental Engineering, Inc., a firm which establishes safety programs for various companies. He has a bachelor of science degree in chemical engineering and has taken courses in industrial hygiene and law (Tr. 111, 112). He is a certified Safety Professional (Tr. 113).

As respondent is one of his clients, Mr. Overturf, responding to a call from Campbell, came to the site the same day of the inspection but after the compliance officer had left (Tr. 124, 125).

According to Mr. Overturf, he examined the type of soil in the excavation and determined that it was of a clay and sandy consistence-the type of material out of which adobe bricks were made. He observed no sloughing, spoiling, tension cracks or pressure deformation such as to indicate a shift or movement of the soil (Tr. 126, 127). While the walls of the excavation were of moist clay material, there was no intrusion of water and the bottom was dry (Tr. 128). From his observation, there was a slope of the top five feet of the excavation (Tr. 128, 129).

Mr. Overturf testified he took soil samples back to the lab to see what the binder was. He used a bonding test to see if there was any cause of sloughing. This consisted of gripping the soil to see how it bonds together (Tr. 137, 158). He conceded that at any time ground water would be found, there would be unstable soil which would require driving sheet pile (Tr. 159).

Concerning the spoil on the side of the excavation, he found it was approximately three feet "overall, in average" and in places where "it might be more. . .you would have to stretch it to make four feet out of it" (Tr. 129-130).

With respect to the ladder, the subject of Citation Number 2, Mr. Overturf testified that he used it to get into and out of the excavation. He weighs 300 pounds and specifically stepped on the apparently broken rung and it held his weight (Tr. 135). The other men on the site used the ladder and there were no reports of injuries (Tr. 136).

II.

Respondent is charged under Item 1A of Citation 1 with failing to guard the walls or faces of an excavation in which employees were exposed to danger from moving ground by the use of a shoring system, sloping of the ground, or some equivalent guarding means.

The Secretary introduced evidence of the composition of the soil through the expert testimony of Mr. Blakeney. His tests showed the soil to be soft to moderately stiff fat clay, fine sand, and a water bearing sand. He found evidence of negative sloping or overhang near the bottom (Tr. 56, 57). He was able to ascertain a specific depth (13.6 feet) at which soil of this constituency and

composition would fail. Other factors indicated, however, that the likelihood of failure could easily occur at a lesser depth.

There was the presence of significant rainfall in the Mobile area on the prior two days ranging from 4 to 12 inches in the closer environs. Because he did not know its specific location, Mr. Barnes could not testify as to the amount of rainfall at the work site. Nevertheless, it is fair to assume that there was a significant amount such as would permeate at least upper levels of soil and penetrate tension cracks and thus increase stress.

There is also evidence of the use of machinery by the excavation. This consisted of a backhoe and a boring machine which had to be set in the excavation (Tr. 154). There also was traffic on adjacent streets. These factors would create additional stress.

Finally, the spoil on the sides of the excavation described as four feet high by Mr. Layton and three feet by Mr. Overturf would increase pressure on the walls of the excavation.

All of these factors indicate that the excavation, as it existed at the time of the inspection, required guarding by a shoring system, sloping, or equivalent methods to insure the safety of the workers.

I have carefully considered the testimony of Mr. Overturf, presented by respondent as an expert. His testing, which consisted of visual inspection and a bonding test, was not nearly as comprehensive as that of Mr. Blakeney, an expert in the specific area of soil analysis.

Mr. Overturf also testified that there was some sloping of the first five feet of the excavation which he determined was adequate for safety (Tr. 128, 129).

However, he did not measure the angle. Mr. Layton disputed that there was any sloping at all (Tr. 83). Examination of the photographs indicate there may have been slight sloping of one wall (Ex. C-7) but of such a minimal degree as not to be significant.

Considering all of the evidence, I must conclude that respondent did not comply with the requirements of the cited standard. The violation was serious. It is clear that a cave-in of the walls of the excavation could cause death by suffocation to the three workmen.

Under Item 1B of Citation 1, respondent is charged with failing to comply with the provisions of 29 C.F.R. § 1926.651(i)(1) by not effectively storing or retaining excavated or other material at least two feet or more from the edge of the excavation.

The evidence is clear that there was spoil piled on the right edge of the excavation. The compliance officer stated that it was four feet high and Mr. Overturf conceded the spoil averaged three feet. This amount of soil so placed at the edge could slip into the excavation and fall on the workmen directly below. Vibrations from nearby traffic and on-site machinery increased the hazard.

Mr. Overturf testified that the spoil could not be moved back because of the adjacent road and, in fact, several businesses at the location had complained of same spillage of soil on the street (Tr. 130). However, the evidence suggests that compliance could have been achieved by moving the soil back the required two feet or by hauling it away (Tr. 86, 150-157).

The violation is alleged as serious. However, from review of the exhibits and the testimony, I cannot conclude that death or serious injury would result merely from the slippage of the soil banked on the edge of one side of the excavation. Certainly, it would compound the hazard created if a wall of the excavation would cave and contribute to the added weight and mass of dirt. However, evidence that the slippage of the spoil alone into the excavation would cause death or serious injury is lacking. Accordingly, I do not find that this violation of Citation 1 is serious.

The Secretary proposes a penalty of $420 for the combined violations alleged under Citation Number 1. As noted, I have found Item 1B to be nonserious. The violation charged under 1A is undoubtedly serious with the probability of death by suffocation resulting in the event of a cave-in. Considering this and the statutory adjustment factors, I conclude that a penalty of $300 for Item 1A is appropriate and equitable.

Under Citation Number 2, respondent is charged with failing to comply with 29 C.F.R. § 1926.450(a)(2) and (a)(10) by permitting employees to use an unsecured defective ladder.

The evidence is clear that the third rung of the ladder was broken and two rungs were bent and Mr. Overturf conceded that the ladder was defective (Tr. 159, 160). While Mr. Overturf may have been able to use the ladder and apply his 300 pounds of weight, this is no guarantee that at some future time the defective or bent rungs would fail and cause injury to a workman. In any event, the standard requires that defective ladders not be used and, if defects discovered, they are to

be removed from service. It is clear, therefore, that respondent was not in compliance with the cited regulation.

The evidence is also clear that the ladder was not tied, blocked, or otherwise secured to prevent displacement. It was sitting on oyster shells which had been placed on soft water bearing sand. Under the circumstances, it is evident that it could be displaced and cause injury to workmen. Accordingly, I find respondent failed to comply with the cited regulation.

III.

Based upon the evidence of record, I reach the following findings of fact and conclusions of law:

FINDINGS OF FACT

1. On May 7, 1981, respondent was engaged in a pipe laying project at Highway 90 and Fairway Drive, in Mobile, Alabama.

2. On the morning of that date, a compliance officer for the Secretary made an inspection of the work site.

3. Three of Campbell's employees were working or standing in an excavation which was approximately 42 feet long, 15 feet wide and 10 feet, 9 inches deep. Oyster shells were being placed in the bottom of the excavation in a four-inch layer over soft white sand. A backhoe was being operated at one end.

4. The excavation was not shored, sloped, or otherwise guarded to effectively prevent the hazard of cave-in.

5. There was spoil of a depth of three to four feet piled along one side of the excavation which was not laid back at least two feet from the edge.

6. The soil at the excavation was composed of soft to moderately stiff fat clay down to the eight-foot level. From this level down to a depth of 9.8 feet, there was a mixture of clay material and oyster shells. Below this to a depth of 11 feet, there was fine and water bearing sand. There had been movement of the soil as evidenced by the fact that the auger used in testing penetrated in and out of virgin soil.

7. Soil stress tests disclosed that failure of the soil could occur under a vertical cut of 13.6 feet. This failure point could occur at a lesser height due to other factors such as vibrations from machinery at the site, nearby traffic, and rainwater penetrating tension cracks in the soil.

8. Respondent did operate machinery by the excavation which also was adjacent to a road with vehicular traffic. There also had been a heavy rainfall of between 4 to 12 inches in the Mobile area in the previous two days and the work site was subjected to a significant amount of this rainfall.

9. The composition of the soil and the weight of the spoil on the edge, together with the above-noted factors, were such as to create a hazard of cave-in of the walls of the excavation.

10. A cave-in of the excavation could bury workmen in it and cause death by suffocation.

11. The evidence does not establish that death or serious injury would result from the slippage above of the spoil piled on the edge of the side of the excavation.

12. A ladder used by workmen to enter and leave the excavation had one broken and two bent rungs. It also was not tied, blocked, or otherwise secured.

## CONCLUSIONS OF LAW

1. Respondent is engaged in a business affecting commerce within the meaning of the Act and this Commission has jurisdiction over the subject matter and parties to this action.

2. Respondent was in violation of Section 5(a)(2) of the Act by failing to comply with the provisions of 29 C.F.R. § 1926.651(c). The violation was serious.

3. Respondent was in violation of Section 5(a)(2) of the Act by failing to comply with the provisions of 29 C.F.R. § 1926.651(i)(1), 1926.450(a)(2), and 1926.450(a)(10). The violations were not serious.

Based upon the foregoing findings of fact and conclusions of law, Item 1A of Citation 1, as amended, for a serious violation is affirmed and a penalty of $300 is assessed therefor. Item 1B of Citation Number 1, as amended, and Citation 2 for non-serious violations are affirmed.

SO ORDERED.

Dated this 25th day of January, 1982.

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR,<br>Complainant,<br>v.<br>P & Z COMPANY, INC.,<br>Respondent. | OSHRC Docket No. 76-431 |

ORDER

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

This case involves allegations by the Secretary of Labor that P & Z Company, Inc., violated a standard requiring covers on garbage containers, and willfully violated standards requiring the clearing of scrap lumber from work areas and passageways, and the illumination of work areas. The case is before us for the second time. In P & Z Co., 77 OSAHRC 211/F5, 6 BNA OSHC 1189, 1977-78 CCH OSHD ¶ 23,413 (No. 76-413, 1977), the Commission vacated the administrative law judge's first decision and remanded the case with instructions to make specific findings of fact based upon an analysis of the entire record and to explain his credibility evaluations. After the judge issued another decision largely adverse to the Secretary, the Secretary requested that the Commission again grant review to correct alleged errors and oversights in the judge's factual findings. Review was directed by Commissioner Cleary under 29 U.S.C. § 661(i). Because we are now of the opinion that review is no longer provident, we vacate the direction for review.

The issues now remaining in this case are largely factual; the case poses no unresolved legal questions. See Keystone Roofing Co. v. OSHRC, 539 F.2d 960, 964 (3rd Cir. 1976). Although the Secretary's primary interest in this case was apparently to show that P & Z committed willful violations, the Commission has, since review was directed, issued many fully considered opinions on willfulness. See, e.g., Mel Jarvis Construction Co., 81 OSAHRC 89/B13, 10 BNA OSHC 1052, 1981 CCH OSHD ¶ 25,713 (No. 77-2100, 1981). To consider again whether willfulness appears in the record would serve little purpose, particularly here, where the record is unclear. The alleged violations involved conditions of low gravity and abatement is not a concern because construction at the worksite has been completed. Under all these circumstances, it would no longer be provident to review this case. See A.C. & S., Inc., 76 OSAHRC 93/A2, 4 BNA OSHC 1529, 1976-77 CCH OSHD ¶ 20,955 (No. 2229 et al., 1976).

Accordingly, the direction for review is vacated.

FOR THE COMMISSION

Ray H. Darling, Jr.

RAY H. DARLING, JR.
Executive Secretary

DATED: FEB 26 1982

COTTINE, Commissioner, dissenting:

The majority decision to vacate the direction for review in this case deprives the aggrieved party of his day in court and marks a serious departure from prior Commission practice.

In response to a petition for discretionary review filed by the Secretary of Labor, Commissioner Cleary directed this case for review on May 12, 1978. On September 7, 1978, the Commission denied the Respondent's motion to strike the Secretary's petition or in the alternative to reconsider the decision to direct the case for review. On September 29, 1978, the Commission denied the Respondent's motion for oral argument. Three and a half years later, with no intervening change in law, no apparent lack of party interest, and after the directed issues have been briefed, the Commission has determined that review is no longer provident. In support of their result my colleagues cite A.C. & S., Inc., 76 OSAHRC 93/A2, 4 BNA OSHC 1529, 1976-77 CCH OSHD ¶20,955 (Nos. 2229 et al., 1976). However, A.C. & S. provides no support for the majority action in this case.

In the past the Commission has declined to review cases where the record revealed both an absence of party interest and no compelling public interest warranting review. See, e.g., Middletown Volkswagen, Inc., 80 OSAHRC 50/F7, 1980 CCH OSHD ¶24,493 (No. 77-349, 1980)(not reported in BNA); Chrysler Casting Corp. - Fostoria Foundry, 79 OSAHRC 98/A2, 8 BNA OSHC 1088, 1979 CCH OSHD ¶24,035 (No. 76-3877, 1979; Cargill, Inc., 79 OSAHRC 90/A2, 7 BNA OSHC 2045, 1979 CCH OSHD ¶23,981 (Nos. 78-2862 & 78-2864, 1979); Structural Metals, Inc., 79 OSAHRC 43/E4, 7 BNA OSHC 1452, 1979 CCH OSHD ¶23,635 (No. 78-3352, 1979); Potlatch Corp., 79 OSAHRC 34/F6, 7 BNA OSHC 1370, 1979 CCH OSHD ¶23,549 (No. 77-3589, 1979); John R. Jurgensen Co., 79 OSAHRC 17/E4, 7 BNA OSHC 1251, 1979 CCH OSHD ¶23,403 (No. 77-256, 1979). However, in no case

has the Commission declined to review specifically directed issues[1/] without either: (1) affording affected parties the opportunity to object, A.C. & S., Inc., supra; (2) concluding there is a lack of party interest, Trans World Airlines, Inc., 79 OSAHRC 4/D10, 7 BNA OSHC 1047, 1979 CCH OSHD ¶23,277 (No. 76-3506, 1979); or, (3) permitting the parties to clarify whether there is party interest in Commission review in light of an ambiguous record on this point, Champion Construction & Engineering Co., 78 OSAHRC 102/A2, 6 BNA OSHC 2116, 1978 CCH OSHD ¶23,186 (No. 76-2576, 1978).

A.C. & S., Inc., supra, ("the Sears Tower cases"), involved a judge's decision in 16 consolidated cases arising out of inspections conducted in 1972 at the Sears Tower construction project in Chicago. Of the 16 original Sears Tower cases on review, four lacked both party interest and compelling public interest and the relevant portions of the judge's decision were affirmed without review under Abbott-Sommer Inc., 76 OSAHRC 21/A2, 3 BNA OSHC 2032, 1975-76 CCH OSHD ¶20,428 (No. 9507, 1976). One case involved issues of law and fact not present in the 11 remaining cases and was severed for decisional purposes under Commission Rule 10, 29 C.F.R. §2200.10, and later decided on the merits.[2/] The remaining 11 cases involved common legal issues that had been decided by the Commission after the Sears Tower cases were directed for review and briefed by the parties. Accordingly, in the Commission's view, the cases "no longer present[ed] novel or unsettled questions," and "a decision on these issues [was] no longer crucial in formulating national policy to aid in the Act's administration." 4 BNA OSHC at 1532, 1976-77 CCH OSHD ¶20,955 at p. 25,175. The attention of the parties was directed

---

1/ See also Commission Policy Statement, 41 Fed. Reg. 53014 (1976).

2/ Crescent Erection Co., 77 OSAHRC 145/B12, 5 BNA OSHC 1711 (No. 2159, 1977) (not reported in CCH).

to relevant new case law. In deciding that review was no longer provident the Commission noted that recently decided precedent would require supplementary presentations by the parties in order to provide full review.[3/] However, the Commission did not simply vacate the orders directing review of these cases. Rather, each affected party was afforded the opportunity to object to the vacation of the directions for review. In addition, an affected party could request a decision on the existing record, a remand for further proceedings, or an opportunity to pursue a negotiated settlement. Of the 11 affected respondents, three filed objections and their cases were subsequently decided on the merits.[4/]

In contrast to the record on review in the Sears Tower cases, the record in this case is complete. There has been no intervening change in law that would require supplementary evidence or argument by the parties. Finally, the parties have not been afforded an opportunity to object and thus have been denied their day in court.

The Commission states that "the issues now remaining are largely factual; the case poses no unresolved legal issues." The issues in this case always have been factual; there never have been unresolved legal questions.[5/] Furthermore, an absence of legal issues is not fatal to

---

3/ Under Commission Rule 93, 29 C.F.R. §2200.93, adopted on Dec. 5, 1979, 44 Fed. Reg. 70111, parties whose cases have been directed for review are issued a briefing notice "at a time reasonably in advance of the date when the case is scheduled for disposition at a Commission meeting." Under prior Commission practice briefs were to be filed within 30 days after the case was directed for review.

4/ Mayfair Const. Co., 77 OSAHRC 178/A14, 5 BNA OSHC 1877, 1977-78 CCH OSHD ¶22,214 (No. 2171, 1977); Illinois Bell Telephone Co., 77 OSAHRC 178/A2, 5 BNA OSHC 1884, 1977-78 CCH OSHD ¶22,209 (No. 2097, 1977); Skidmore, Owings, & Merrill, 78 OSAHRC 1/A2, 5 BNA OSHC 1762 1977-78 CCH OSHD ¶22,101 (No. 2165, 1977).

Two other respondents in the consolidated Sears Tower cases that had originally sought Commission review, Anning-Johnson Co. and Inland-Ryerson Construction Products Co., did not object to the vacation of the orders for review.

5/ The absence of legal questions may be sufficient to preclude a finding of compelling public interest warranting review. See Middletown Volkswagen, Inc., supra, 1980 CCH OSHD ¶24,493 at p. 29,922 n. *. However, it does not affect party interest in review.

Commission review. Under Commission Rule 92(b), 29 C.F.R. §2200.92(b), assertions that a judge's finding of material fact is not supported by a preponderance of the evidence or a judge's decision is contrary to decisions of the Commission are appropriate grounds to be considered by Commission members in the exercise of their statutory review authority under 29 U.S.C. §661(i). Similarily, Commission Rule 92(d), 29 C.F.R. §2200.92(d), provides that "Except in extraordinary circumstances, the Commission's power to review is limited to issues of law or fact raised by the parties in the proceedings below." (Emphasis added.)

The Secretary of Labor petitioned for review. The petition was granted by Commissioner Cleary and the parties have briefed the issues. There is no sound reason for not deciding the issues on review.[5/] If providence is lacking in this appeal, it has been lacking since it was originally directed for review. Furthermore, fundamental fairness requires at a minimum that the parties be afforded the same opportunity to object to the lack of decision as was afforded the parties in the Sears Tower cases.

Accordingly, I dissent.

---

5/ The majority concludes that "whether willfulness appears in the record would serve little purpose, particularly here, where the record is unclear." The record in this case is long, and the factual issues presented are many. However, it is the role of the Commission as the adjudicatory body under the Act to resolve disputed issues, not to avoid those that may be lengthy, tedious, or not subject to easy resolution.

Appearances:

Harry W. Scott, Jr., Esq.
Richard Voigt, Esq.
For Complainant

Harold Gordon, Esq.
Lorin H. Bleecker, Esq.
For Respondent

DECISION ON REMAND

The Complainant, Secretary of Labor, received a complaint from an unnamed employee of the Respondent, P and Z Company, Inc., that P and Z's employees were being subjected to safety hazards at a job site in the vicinity of 12th and Pennsylvania Avenue in Washington, D.C. where the Respondent was one of many construction contractors involved in building a subway system in that city.

The Secretary sent an inspector to the site on December 9, 1975. After his inspection was completed two days later on December 11, 1975, four citations were issued against the Respondent alleging that P and Z had been found to be in violation of numerous construction

standards and recommending that a penalty of $6,110 be assessed. P and Z filed a notice of contest of all citations and penalties. After a hearing which began on June 2, 1976 and was concluded on July 1, 1977, the citations were vacated in part and affirmed in part.

Upon review, the Commission ordered that the judge's decision be vacated, the case be remanded and that specific findings be made on each item of all citations.

Citation No. 2 alleging a violation of 29 CFR 1926.550(a)(9) and proposing a penalty of $2,000 was withdrawn prior to the original hearing and is therefore not in issue.

CITATION NO. 1

In compliance with the remand order I make the following Findings of Fact. As the evidence hereinafter cited will show neither the wooden box referred to in Citation No. 1, Item 1(a) nor the 55-gallon drum mentioned in Citation No. 1, Item 1(b) was equipped with a cover but there also is no proof that these receptacles were identified as trash barrels or containers belonging to P and Z and designated for use

by its employees. There were a great number of contractors performing work in this area. Moreover these receptacles were close to public streets and sidewalks where employees of the other contractors and pedestrians passed by in great numbers.

With reference to Citation No.1, Item 2, I find, as will hereafter be shown, that the alleged flagman was in fact a pile driver who had been employed two or three days. A red or orange vest had been provided for him and all other employees by P and Z. Because of Compliance Officer Wiseman's failure to make diligent inquiry, I am unable to find as a fact that this man had even been told by a P and Z supervisor to direct traffic or that he was to wear a flagman's vest while doing so.

Items 3 and 4 of Citation No. 1 were affirmed and will be covered in a detailed discussion of evidence below. Because of the complexity of the numerous issues involved in the eight sub-items mentioned in Citation No. 3, they will be discussed in sequence below.

For the reasons hereinafter set forth I can find no basis upon which to find P and Z was guilty of intentional, conscious and deliberate acts which subjected its employees to occupational hazards. I concur in the Commission's conclusion that the trial judge, who has the opportunity to observe the demeanor of the witness when testifying under oath, is best able to determine their credibility. The findings and conclusions hereinafter set forth take into consideration the ill-concealed and very obvious anti-P and Z bias of Jennings and Bamsey (both had been fired for safety violations) and Compliance Officer Wiseman's inept and inadequate pursuit of the facts.

THE ALLEGATION OF WILLFUL VIOLATION
IN CITATIONS NO. 3 AND 4

Citations Nos. 3 and 4 alleged that P and Z willfully exposed its employees to injury from scrap lumber with protruding nails and poor lighting in a tunnel. Neither of the alleged violations could be considered to be likely to cause serious injury or death. However, because they were classified as being willful violations by the Compliance Officer Wiseman and his supervisor Saulter, each of these citations resulted in the recommendation that the employer be assessed a penalty of $2,000.

Under the provisions of 29 U.S.C.A. §666(a) any employer who willfully violates the Act of any standard, rule or order may be assessed a civil penalty up to but not more than $10,000 for each such violation. 29 U.S.C.A. §666(i) provides that determination of the appropriate amount of penalty is to be computed by giving due consideration to size of the business of the employer being charged, the gravity of the violation, the good faith of the employer, and the history of previous violations.

The evidence adduced by the Secretary through the witness Wiseman in support of the proposed penalties although liberally supplied with Wiseman's conclusions based upon the arbitrary formula devised by the Secretary does not comply with the requirements of Section 666(i). Size of the business obviously is intended to be considered in determining how much of a penalty is required to have a deterrent effect upon the employer, but the Secretary uses an arbitrary formula based upon the number of employees which does not necessarily show the

the ability of an employer to pay a penalty (Tr. 3, p. 179, L. 15). What, if any, consideration to the criteria prescribed by the statute were followed by Wiseman in computing the penalty must be derived from his arbitrary conclusion based upon statistical data he accumulated as shown by his testimony (See Tr. 2, p. 64, 65, 66, L. 15 and L. 23; 67, L. 1-7; p. 68, L. 1-14 and 23; p. 80, and Tr. 3, p. 179 and Exh. C-35, Penalty Worksheet).

Wiseman said that under history he considered any citation which had been previously issued to the same employer (Tr. 3, p. 181), whether it had become a final order or not. The previous citation could have been withdrawn by the Secretary himself or vacated after a hearing.

Good faith, as nearly as can be ascertained from the skimpy evidence Mr. Wiseman gave on that subject, was determined solely upon his interview with the employer's project manager who was said to have "indicated" that there was a lighting problem. It was Wiseman's belief that "there was some reluctance on his part" about correcting the condition (Tr. 3, p. 184, L. 20, 25). Finally Wiseman admitted that his final figure when he recommended a $2,000 penalty in each of the alleged willful violations was arbitrarily determined. When asked how he computed the two penalties for alleged willful violation, he said (Tr. 3, p. 199, L. 1-6)

> "This being a willful violation, of the two I felt were willful violations, I did not feel that I could arbitrarily go to the highest mark which would have been the $10,000 mark, so I tried to weigh this in fairness to the contractor and ARBITRARILY (emphasis added) I came up with a $2,000 factor."

Wiseman also said that he gave the employer a zero rating on history because of previous citations and two trips made to the job site (Tr. 3, p. 200, L. 1-5). The significance of two trips to the job site was not explained.

His good faith figure was derived chiefly from hearsay remarks and his own opinion of P and Z's General Superintendent Christiansen. He admitted that he had relied upon hearsay opinions that Christiansen had a very poor performance record after complaints (Tr. 3, p. 201, L. 1-8). He said he "verified" these complaints by conversations with P and Z's safety superintendent and other individuals who were unnamed. This hearsay was uncorroborated. He said, in his opinion, some evidence of a previous citation under the same standard, even where there was a settlement without the matter being tried on its merits, and proof of complaints by employees showed willfulness (Tr. 3, p. 156, 164). He made no distinction between a settlement and a case which is contested (Tr. 3, p. 164, Exh. R-9).

Wiseman also said that he took into consideration a 1973 citation of P and Z for violation of Section 1926.25(a) which was at a different work site and involved hoses, lumber skids, electric wires, concrete scrap, wet concrete spillage; not protruding nails, scrap lumber and debris (Tr. 3, p. 166, 167, Exh. R-10).

Wiseman's supervisor, the Area Director Gilbert J. Saulter approved the issuance of willful citations in Citation No. 3 and No. 4. He said that his decision that a willful citation should be issued was based upon a combination of Wiseman's comments and the Secretary's files. Previous citations were taken into consideration.

He said that if the employer had previous "contact" with OSHA, had been provided with copies of standards, and had an opportunity to accompany the compliance officer in a walk-around that this indicated willfulness (Tr. 8, p. 23). No doubt he also considered Wiseman's derogatory conclusions in his initial report (Exh. R-3, p. 2) that the Respondent had a bad record and that its Construction Superintendent Christiansen ignored all notices of safety deficiencies. This was not sustantiated by any testimony. It was only an accusation.

When asked why he approved the issuance of a willful citation Saulter said that after reviewing the documents in the file (which no doubt included Wiseman's conclusions) and the employer's knowledge of the condition, he thought that a willful citation was justified. He said (Vol. 10, p. 21) "the entire case file, past history, the people involved, the management involved in P and Z. The experience that OSHA has had with the management of P and Z and the knowledge we had that people in management with P and Z were aware of the standards, were aware of the conditions .... that we found at the time of the inspection."

Saulter also explained how the penalty was determined. He said that the "willfulness factor" meant "the degree of willfulness". He explained that "attitude" is where the employer has knowledge and disregards the situation, where he refuses to abate (Vol. 10, p. 26, L. 13-23).

He then referred to the Secretary's Field Manual which defines "degrees of willfulness" for penalty purposes. The Secretary's

(not statutory or by rule) guidelines are: (a) High degree: where the employer intensely disregards safety; (b) Moderate degree: where the employer is indifferent to safety; (c) Low degree: the employer neglects to provide protection (Vol. 10, p. 34). He said that a degree of 2 in a scale of 1 to 10 was used in the instant case which is equivalent to a low degree, that is where there is no intentional disregard (Vol. 10, p. 35, L. 13-17).

Saulter also testified that careless disregard of a standard or employer neglect or indifference indicates willfulness (Vol. 10, p. 36); that his attitude, which can be determined by what precautions the employer has engaged in regarding safety prior to the inspection, is a factor (Vol. 10, p. 39). His attitude is also reflected in what happens after the inspector arrives (L. 10).

Saulter said that even though an allegation of willful violation based upon an inspection must have been derived from an attitude of willfulness before the inspection, that he also considered what happened after the OSHA inspector arrived, the fact that OSHA had made previous inspections, hearsay reports of employees (even though Wiseman was unable to substantiate most of the complaints made by the employees) (Vol. 10, p. 40, 43, 45). Finally Saulter conceded that, based upon the Secretary's Field Manual which he is assumed to have followed, "there...there has to be some basis for concluding that the employer had a chance to comply and deliberately did not." Q. "Is that what you understand it to mean?"

Saulter: "I think that is a fair interpretation, yes, sir."

Upon consideration of the record as a whole after review of the entire transcript of the testimony, I find as a fact that there is no evidence which shows that P and Z had an opportunity to comply with the standards mentioned in Citations Nos. 3 and 4 and deliberately did not.

I further find and conclude, as a matter of law, that where, as here conceded by Saulter, (Vol. 10, p. 35, L. 13-17) there was no "intentional disregard"; that the Secretary of Labor failed to sustain the burden of proof that the alleged violations described in Citations Nos. 3 and 4 were willful. There must be an intentional, knowing or voluntary act. Secretary of Labor v. C. N. Flagg & Company, 11 OSHARC 632 (No. 1734, Sept. 19, 1974). It must be a conscious, intentional, deliberate voluntary decision. F. X. Messina Construction Corporation v. Secretary of Labor, 505 F.2d 701, 702 (1st Cir. 1974).

LACK OF CREDIBILITY OF THE WITNESSES JENNINGS AND BAMSEY

The Secretary's witness Jennings, when asked why he left the employ of P and Z, said "I was fired." (Vol. 6, p. 199). The record reveals that on June 20, 1975, Jennings, who was a shop steward, the representative of the employees, one who should have been interested in their welfare, was given a non-compliance notice by P and Z for failure to direct personnel to pick up their lunch debris after eating (Exh. R-25). He was also given a non-compliance notice by P and Z on November 10, 1975 for permitting an employee under his supervision to work without a safety belt and, finally after his third infraction of rules was fired. He admitted that he had been reprimanded by the superintendent about his failure to clear up the

lunch trash (Vol. 6, p. 202). He testified on direct examination that once he emptied a full trash can on the ground near the trailers (Vol. 5, p. 159, L. 8-10). All of this witness' testimony about overflowing trash pertained either to overflowing trash cans without lids in places where he, as the union steward, had the responsibility of seeing both that they had lids and that they were promptly emptied.

The witness Bamsey was also fired for cause (Exh. R-23). The reason given was refusal to follow orders (Tr. 6, p. 118). He denied this and claimed that he had a legitimate complaint about the hazardous manner in which he was told to perform his work. On cross examination he admitted that it was part of his responsibility to keep his work area clean (Tr. 6, p. 78-80). On the day of the inspection he was engaged in taking out street beams. They were put down on the west side of 12th Street. The areas shown in Exhs. C-32, 33, 34 was a designated area for deposit as directed by his foreman (L. 22-23). This material was later removed by truck (Vol. 6, p. 89). He also identified Jennings as the individual shown in Exh. C-19 as a shop steward and said that he understood that Jennings was supposed to clean the pile driver's change trailers. Although he had previously testified that there was no passageway to the change trailers he then (L. 6-24, Tr. 6, p. 96) admitted that there was a 10 foot wide path through the archway (Vol. 6, p. 97). He admitted that he was given a safety violation notice by P and Z on November 10, 1975, for not wearing a safety belt and another one on November 12, 1975 (Exh. R-22, Tr. 6, p. 116, L. 18-25). He also

admitted that he was served with a termination notice on December 12, 1975 (Vol. 6, p. 118, Exh. R-23) although he disputes the allegation that he had defied his foreman and refused to follow orders. On redirect examination he contended that the way he was told to perform his duties was, in his opinion, hazardous and for that reason he refused to do it. In any event it is clear that this employee, like Jennings, was fired because he persistently disregarded company rules involving safety. Even though he was not so obviously an unreliable witness as Jennings, his record cannot be ignored in evaluating his testimony.

DISMISSAL AND VACATION OF CITATION 1, ITEM 1(d) ON MOTION

The Respondent's motion at the close of the case for the Secretary directed to Item 1(d) of Citation No. 1 alleging that containers on New York Avenue by the vent shaft used for garbage and other refuse were not equipped with covers was granted. The record revealed that this container was a 55 gallon drum overflowing with rubbish, whiskey bottles, wine bottles, and paper. No employee of P and Z was observed using these rubbish cans nor was it even established that they belonged to P and Z or were placed in the public street for the use of P and Z employees. Wiseman testified that he saw "some" 55 gallon drums on New York Avenue near a vent shaft, but his attention to his duties was so casual and inadequate that he wasn't even sure how many he saw. He said there were "at least two". He was asked if he could tell what color they were and again he showed his lack of recollection of the facts by saying

"probably a rusty looking metal color". When he was asked if he could be more specific he couldn't even remember whether they were painted or not (Tr. 2, p. 148).

When he was asked whether there were any identifying marks on them showing that they belonged to P and Z, he acknowledged that there were not. He couldn't remember whether he took pictures. He admitted that he had not seen any P and Z personnel using them (Tr. 2, p. 149). When he described the area where they were located he said the vent shaft was in the center of the street, that there was a bus station on one side of the street, a restaurant on the other side and a book store in the middle of the block and that there was a median strip in the center of the street. It was a natural median strip travelled by the public where pedestrians crossing from the sidewalks from either side could pass by. It was an area of trees, shrubbery and grass. There were a number of fast food outlets in the area also, places where it is likely that there would be debris from discarded containers procured from the fast food outlets (Tr. 2, p. 150).

The Respondent's motion, also made at the close of the case for the Secretary, to vacate so much of Citations Nos. 3 and 4 as alleged willful violation of the Act was also granted. As has been previously pointed out, the recommendation of Wiseman that a willful citation be issued was predicated upon such a flimsy premise that his supervisor Saulter should have refrained from accepting his recommendation. Wiseman relied solely on uncorroborated complaints by disgruntled employees and other third hand information. There is not even a

scintilla of evidence of a conscious, intentional, deliberate, voluntary decision (F. X. Messina Construction Corp. v. Secretary of Labor, 505 F.2d 701, 702 (1st Cir. 1974)) to permit protruding nails and other debris to be accumulated in work areas and passage ways or deprive employees of the minimum requirements for illumination in the work place.

CITATION 1, ITEM 1(a)

Citation 1, Item 1(a) alleges that a wooden container used as a refuse container was not equipped with a cover. The record revealed that P and Z had not designated any wooden containers for trash (Christiansen, P and Z's superintendent, Tr. 10, p. 79, June 29, 1976; Tr. 12, p. 10). Wiseman only "assumed" that this box was a P and Z designated trash container (Tr. 2, P. 141, L. 23, 24), but admitted that there were no markings to identify it as such (Tr. 2, p. 142), and that it was in an area accessible to the general public between the street and the sidewalk (Tr. 2, p. 143). Wiseman made no attempt to find out who put the box there or who, if anyone, told P and Z employees or any other employee on the project to dispose of trash there (Tr. 2, p. 144). He admitted that the employer representative who accompanied him on the walk-around (Fallon) was unable to enlighten him (Tr. 2, p. 144, L. 21, 22), yet he made no attempt to inquire further. He said he relied on a statement of the union steward, Jennings, the same Jennings who was disciplined by P and Z for failure to dispose of accumulated trash (Tr. 3, p. 210). The assumptions of a compliance officer supported only by the testimony of an unreliable witness who has been shown to be a contributor to

an accumulation of trash are insufficient to support this allegation of violation.

CITATION 1, ITEM 1(b)

The allegation that P and Z furnished 55 gallon drums without lids for use of its employees as trash containers was also based upon Wiseman's assumptions and unsupported conclusions derived from comments by the union steward (Tr. 1, p. 140, L. 1-6). Wiseman admitted that there were no markings on the drums identifying them as P and Z property (Tr. 2, p. 144, 156). The Shop Steward Jennings, whose hostile attitude towards P and Z was apparent, attempted to make it look like these were P and Z trash cans, by depositing some trash in one of the drums in Wiseman's presence during the walk-around (Tr. 2, p. 147).

P and Z's Safety Superintendent Fallon who had since left the employ of P and Z and was at the time he testified employed by Volpe-Head, a joint venture, was a witness for the Secretary. He was also with Wiseman during the entire tour of the job site. He said P and Z had never designated 55 gallon drums as trash containers (Tr. 4, p. 179, L. 3-5, p. 187, L. 6 & 7). 55 gallon drums furnished by P and Z were supposed to be used for segregation of materials such as bolts, plates and washers, according to Fallon (Tr. 4, p. 178) and to hold water for fire protection (Tr. 5, p. 116, Tr. 5, p. 90, L. 17-25, p. 91. L. 4-6 testimony of Christiansen, job superintendent). Christiansen also said as did Fallon that no 55 gallon drums were ever designated as trash containers by P and Z (Tr. 10, June 29, 1976, p. 79).

CITATION 1, ITEM 1(c)

It was alleged that garbage containers located inside the carpenters and laborers change trailers were not equipped with covers. It is not disputed that this condition existed on the day of the inspection. They not only did not have lids but some of them were overflowing (Tr. 5, p. 157, 158; Tr. 1, p. 140, L. 19). Wiseman's recollection of details however was very vague and uncertain. When asked to describe the containers his answer was qualified by such expressions of uncertainty as "...if I remember rightly" "...from the best I can remember, they were more or less (emphasis added) of the cardboard box type". When asked if some were plastic he said "possibly, yes". When asked again if they were cardboard he said "not necessarily" thus contradicting himself (Tr.2, p. 147, L. 11).

P and Z's former safety superintendent conceded that keeping the trash cans in the trailers neat had been a problem (Tr. 4, p. 96). The Secretary's witness Jennings was part of the problem. Six months before the inspection he was disciplined by P and Z for failing to make sure lunch debris was properly disposed of (Exh. R-25). This was part of his responsibility (Tr. 6, p. 163; Tr. 5, p. 159, 160). He could have complained to the union business agent if P and Z had not been cooperating with him but he never did (Tr. 6, p. 182). He admitted being reprimanded for not keeping the trash in the trailers cleared (Tr. 6, p. 195, 201, 202).

CITATION 1, ITEM 2

In Citation 1, Item 2 it was alleged that a flagman was not provided with and did not wear a red or orange garment while flagging on the west side of the 300 block of 12th Street, Northwest. The documentary record shows that on June 9, 1975, P and Z issued a directive applicable to flagmen to all supervisors and foremen. In addition to instructions as to how to signal it was specified that flags and vests were available in the tool room. Nothing else was to be used as a substitute except during inclement weather when raincoat jackets might be used instead of vests (Exh. R-17). This item was vacated on the motion of the Respondent at the close of the case for the Secretaary. It is not disputed that vests were provided. The employee was a new one, the question was whether he had been told where to get a vest and when it was required that it be worn. Wiseman neglected to inquire about this. Not even a prima facie case of violation as alleged in Item 2 was established.

The Pile Driver Steward Jennings testified that he knew the man shown in Complainant's Exh. C-13, that he was a pile driver in his own crew, had only been on the job two or three days, and admitted (Tr. 6, p. 176, L. 10) that he had never instructed this man that he had to wear a vest. He acknowledged that under the union contract only a member of the union, such as he who was the pile driver steward, could give such instructions. A supervisor was prohibited from doing it (Tr. 6, p. 177, L. 17-18, p. 178, 179).

This item was properly ordered vacated on motion of the Respondent because of the Secretary's failure to sustain the burden of proof.

CITATION NO. 1, ITEM 3

The allegation that used lumber with protruding nails was stacked on the west side of the 300 block of 12th Street by the north archway entrance was not disputed. It is true that there was some debris from passing pedestrians and other persons not employed by P and Z (Tr. 10, p. 96, L. 10; Exh. C-18, C-21, C-31). However it is obvious that the Secretary thought that the risk of injury was slight. No penalty was recommended. The evidence fully supports a finding that a violation as alleged in Item 3 of Citation No. 1 should be affirmed without penalty as proposed by the Secretary.

CITATION NO. 1, ITEM 4

It was alleged that arc welding operations at the north end of the escalator area of the station platform were not shielded by non-combustible or flame proof screens which would protect other persons in the area from flash burns. No penalty was proposed.

The overwhelming weight of the evidence shows that the Respondent did not adequately comply with the requirement that shields be in place during welding operations but the risk to passing employees from flash burn because of exposure of their eyes to this intense light was minimal due to the fact that the welders were so positioned that the structural formation of the tunnel screened them off from most of the light (see testimony of Wiseman Tr. 1, p. 157-172 and Fallon Tr. 4, p. 110-116). The evidence sustains the allegation of violation and the recommendation that no penalty be assessed.

CITATION 3, ITEM 1 (g)

It was alleged in this citation that there was a violation of 29 CFR §1926.25(a) for failure to protect employees from protruding nails in construction form and scrap lumber at nine different locations. It was asserted that this material had not been adequately cleared from work areas and passageways. Item 1(g) was vacated on motion of the Respondent at the close of the case for the Secretary because the evidence revealed that area involved was in the center of a public street. An unidentified workman was observed as shown in Exh. C-23, C-25 in the area referred to but neither Wiseman nor Fallon was able to connect him with any work being performed there by P and Z (Tr. 2, p. 25, Tr. 4, p. 129). This item too was vacated at the close of the case for the Secretary.

CITATION 3, ITEM 1(a)

This area included a designated trash site (Tr. 10, p. 109, Exh. C-33). P and Z's sub-contractor provided rollaway containers for debris and also periodically hauled away debris. Skip boxes were on the job site along with the rollaway containers on December 9, 10 and 11, 1975 (Tr. 5, p. 94 and 95). Because of the shortage of storage space scrap material like some of that shown in the exhibits introduced in support of Citation No. 3, was often stacked if there wasn't transportation for its removal available immediately. If it was reusable some of it was put in skip boxes or dumpsters in a designated trash storage area. The west side of 12th Street was one of those areas (P and Z supervisor Huffman, Tr. 11, p. 48).

This site was in a congested area where concrete had been previously poured. It is common knowledge that when concrete forms are stripped there can be a rapid accumulation of scrap material so that instant removal is not possible, However, it cannot be said, in the absence of more convincing evidence than that adduced by the Secretary, that a violation has been established. Inspector Wiseman and his colleagues failed to find out precisely how long this material had been accumulated. There is no persuasive evidence that the Respondent violated Section 25(a) at this site.

CITATION 3, ITEM 1(b)

Some of the debris present in Exh. C-14 is the type of debris thrown by passing pedestrians. This site was in a public street (Tr. 10 2nd, p. 127, 128). No one was working there. Welding machines shown in Exh. C-18 were not in use (Tr. 5, p. 70, L. 13-21). Huffman, P and Z's general superintendent, testified that on December 10th there were two 14 yard trash trucks and a 20 yard dumpster at the 300 block at 12th Street. They also had a John Deere tractor and skip boxes in the excavation. Building materials were loaded into dump trucks and skip boxes (Tr. 11, p. 42, 44). Moreover the area was under the control of another contractor, Crough, an electrician. His offices were located in that area. Huffman said that if an employee was required to get any of the reusable materials he could just reach in and pick it up or if it wasn't accessible he could have a crane pick it up (Tr. 12, p. 25). The toilets shown in the Secretary's photographs (Exh. C-21, C-31) made it appear that the only means of access was over a pile of debris. This was not true. There was an unobstructed means of access to these toilets

(Exh. R-30, Tr. 12, p. 25 & 50).

CITATION NO. 3, ITEM 1(c)

Wiseman testified that he observed debris and trash blocking the path to the control panel shown in Exh. C-17 and C-27 (Tr. 2, p. 19 & 32). He added gratuitously that the housekeeping was the worst he had seen in any metro project he had ever inspected thus revealing his pre-determined conclusion (Tr. 2, p. 35). On the other hand the Secretary's witness Fallon remarked that the panel box was locked and was exclusively under the control of Plymouth Electric. He said that P and Z employees had no electrical responsibility or means of access to it or need to use it (Tr. 5, p. 77). Superintendent Christiansen testified that the area shown in Exh. C-17 was a picture of a designated trash area. This was another example of Wiseman's positioning himself behind a trash area to take pictures to make it look like there was no means of access (Tr. 10, p. 116). Both Christiansen and Huffman testified that only an electrician would have access to the panel (Tr. 10, p. 117, 127, Tr. 11, p. 54). Huffman testified that he was there when the picture was taken, that there was an aisle which was not shown. He had walked through it himself with the electrician (Tr. 11, p. 55 and 56). Witness Christiansen explained that the photograph identified as Exh. C-27 was taken at the east end of the change sheds. He said that no one going to the change sheds would have had to climb over the debris shown in the picture. Reference to Exh. R-30 shows that the camera was pointed over a designated trash area from a location where the passageway could not be seen (Tr. 10, p. 6).

The job site involved several million pounds of steel, sixty thousand yards of concrete, a million board feet of lumber, ten thousand tons of structural steel and very little space for storage of debris (Tr. 10, p. 8 - 11). The Respondent put in the record numerous documents showing that the Respondent contracted for trash dumpsters, containers for the deposit of trash, that numerous invoices had been submitted for trash removal performed by sub-contractors (see Exhs. R-33, 34, 35, 36, Tr. 10, p. 13-17).

CITATION NO. 3, ITEM 1(d)

In this item it was alleged that there was debris blocking the passageway in the vicinity of the mechanics' shed. According to Wiseman, he observed "used materials, trash and other things (Tr. 2, p. 19) and that he saw an employee wearing a red hat passing back and forth through the area (Tr. 2, p. 20, 21) but as was pointed out by the witness Christiansen (Tr. 10, p. 121, Exh. R-30) this picture again was taken from a position in front of a trash pile where no one would walk in order to enter the mechanics' shed. There was no entrance to the shed from that side (Tr. 10, p. 57, 58). The Secretary's witness Poole admitted that there was access to the toilets without going over the trash pile (Tr. 12, p. 62).

CITATION NO. 3, ITEM 1(e)

In this item the respondent was alleged to have permitted passageways to be blocked by accumulation of used materials on the west side of the 300 block of 12th Street near the change trailers. P and Z's discharged employee Ramsey was offered as a

witness by the Secretary in support of this allegation. He said there was no passageway to the change trailers, that it was necessary to climb over rebars and H beams in the area shown in the photographs identified as Exhs. C-16 & C-19 (the latter is the one where the other discharged former employee Jennings posed for Wiseman) in order to get to the change trailers (Tr. 6, p. 61). On cross examination he admitted that there was in fact a pathway 10 to 15 feet wide which provided access to the trailers without making it necessary to climb over the steel materials shown in the picture (Tr. 6, p. 96). This admission is in direct conflict with his previous testimony where he said "we had to climb over rebars" in order to get to the change trailers (Tr. 6, p. 61). Exh. R-30 shows where Wiseman stood when he took the photograph identified as Exh. C-16. It was taken from a position where the pedestrian sidewalk which provided access to the change trailers could not be seen.

Bamsey's testimony is unworthy of belief. Wiseman's photograph distorted the true situation. Bamsey admitted that there was a passageway behind the debris shown in Exh. C-16 (Tr. 6, p. 99), but he said he usually climbed over the stored material anyway because it was a shorter route to the trailers (Tr. 6, p. 111). He admitted receiving written citations (Exhs. R-21, R-22) for safety violations from P and Z on November 10, 1975 and November 24, 1975 and being discharged for refusal to follow orders.

Wiseman when shown the photograph Exh. C-19 with Jennings posing beside piles of steel failed to mention that employees did not have to cross over this material to get to the change trailers. He instead

said "This is one of the entrance ways that goes into the change trailers" (Tr. 2, p. 21, L. 19 & 20).

The area shown in Exh. C-19 was a designated area for deposit of used materials (Tr. 10, p. 120). Wiseman's photograph and his testimony was inaccurate. There was an unblocked means of access to the change trailers.

CITATION NO. 3, ITEM 1(f)

The testimony offered in support of this item although lacking in accuracy because of Wiseman's usual reliance upon assumptions and casual observations without asking pertinent questions to bring out the facts never-the-less is barely sufficient to support an affirmance of the citation. It was not disputed, in fact it was admitted through testimony of two of the Respondent's supervisors Christiansen and Huffman, that the man shown working in the material shown in Exhs. C-28 and C-29 was one of their employees (Tr. 10, p. 122, Tr. 12, p. 26). They had been stripping forms at this site.

CITATION NO. 3, ITEM 1(g)

This item was vacated on the motion of the Respondent at the conclusion of the case for the Secretary.

CITATION NO. 3, ITEM 1(h)

This alleged violation involved an allegation of failure to maintain open aisles free from debris on the west side of 12th Street, between E and F Streets. Wiseman's testimony in support of this item depicted, according to him, in the photographs identified as Exh. C-21 and C-31 was far from specific. He said that when they were coming back from the walk-around they observed men working in and

along the street in an area which was full of debris. They were "evidently" (again he failed to find out) finishing a concrete floor "or they were placing some concrete down into the ground area." (again speculating). He said that there was a compressor in this area where an employee was observed walking across a trash area to get to it (Tr. 2, p. 26). He said Mr. Fallon the safety superintendent told him one of these employees was a compressor operator but he couldn't remember the man's name.

P and Z's Superintendent Huffman disagreed with Wiseman saying that P and Z was not performing any work at this location on December 10th (Tr. 11, p. 62). He said that the finish contractor Crough had his men working there at the time.

CITATION NO. 3, ITEM 1(i)

This item alleges failure to keep aisles and passageways clear of protruding nails and other debris on the west side of the 300 block of 12th Street, N.W., south of Beam S36. The photographs identified as Exhs. C-15, 22, and 23, pertain to this item. P and Z's Superintendent Huffman said that the work going on there was the installation of the outside forms on the dome relief which is the highest part of the subway station immediately below the street. The men depicted in the pictures were forming up in preparation for a concrete pour. Some of the materials there belonged to other contractor's employees. The rebars shown in C-15 belonged to Byurick. The circular piece of concrete shown in the lower right hand corner of Exh. C-15 is a part of a manhole which would later be installed by P and Z.

It is very difficult to ascertain, on the basis of Wiseman's testimony, what the Respondent is alleged to have failed to do in this particular area. When asked what was the basis of the recommendation for the issuance of the citation involved in Item 1(i) he said "regarding Item 1(i) which is the west side of 12th St., this would be the south of Beam S36, which is a very large beam crossing over. There was used materials and lumber scattered in this area and I observed employees walking through this." (Tr. 2, p. 29).

He said that the violation was illustrated in the photograph identified as C-15 but as has been already noted the testimony of Huffman that the material shown there was not debris but material which was to be used in the ensuing completion of what is known as the dome relief. It was impossible to tell what, on the basis of Wiseman's testimony, P and Z should have done here that was not done. There is simply no proof that there were protruding nails and debris in the area depicted in Complainant's Exh. C-15 and the area referred to in Citation No. 3, Item 1(i).

CITATION NO. 4

In Citation No. 4 it was alleged P and Z failed to provide the the amount of lighting required by 29 CFR 1926.56(a) in five different locations. This standard requires a minimum illumination of five foot candles in the area where the employee is working. Although P and Z questioned the accurancy of the readings procured by the Secretary's Investigator Galloway, I am convinced that the equipment used had been properly calibrated before the tests were

made and that the methods utilized by Galloway in making the tests were performed in such a manner that an accurate reading of the light in the area where employees were required to perform work, was accurately determined (Tr. 3, p. 197, 198, Tr. 2, p. 52 - 57).

The readings that Galloway made revealed the following:

(a) outbound tunnel at the entrance of section A-1 under the Traction Power Station - 1.5 foot candle

(b) escalator area on station platform - 1.5 foot candle

(c) inbound tunnel at south end of station - 2.52 foot candle

(d) south service room - .5 foot candle

(e) E Street vent shaft - 2.00 foot candle.

There is clear and conclusive proof that P and Z did not meet the requirements of the standard in this particular instance. Moreover it was revealed in the closing conference (Tr. 2, p. 62) that management was aware of this. That is not disputed. According to P and Z's Safety Superintendent Fallon there had been inadequate lighting on prior occasions during the time he was employed by P and Z. This was in May, 1975 (Tr. 5, p. 31). However it was in a different area - the south service room. He noted that the electrician had it on his schedule to correct two days later on May 14, 1975 which indicates that P and Z's policy was to abate hazards promptly (Tr. 5, p. 32). It was revealed that on June 26, 1975 the lighting had been increased to 5 foot candles. Subsequently Fallon had discussed inadequate lighting with Plymouth Electric whose responsibility it was to take care of such matters (Tr. 5, p. 33).

P and Z's general superintendent, Christiansen, said when testifying for the Respondent that the sand blasting sub-contractor's employees who worked at night often destroyed light bulbs which created an illumination problem when P and Z employees came to work the next day (Tr. 10, p. 24, 25). Superintendent Huffman testified that he visited the job site every day. He recalled that a string of lights was up on December 10th (Tr. 12, p. 6 and 7). Huffman said that strings of lights and spotlights with an extra extension cord were always available when needed. He agrees with Christiansen that the sand blasters broke a lot of light bulbs. He said that they had been working the night before the inspection on December 10th (Tr. 12, p. 8) but employees were instructed to get additional lighting if there was not enough light (Tr. 12 p. 9).

It cannot be disputed that a prima facie case of violation was established and that the evidence adduced in behalf of the Respondent failed to diminish the presumption that a violation had occurred. However evidence of any willfulness is totally lacking. To the contrary the evidence shows that whenever there was a light problem that prompt action was taken by P and Z's safety superintendent to rectify the deficiency. Employees were aware that adequate lighting equipment was available and were on notice that they could secure it when requested. P and Z's only deficiency was its inability to bring the lighting up to standard in less than two days. This however is far short of indicating a conscious, intentional, and deliberate attempt to subject its employees to the hazards caused by inadequate light.

FINDINGS AS TO WHETHER ALLEGED VIOLATIONS STATED IN CITATIONS NOS. 3 AND 4 WERE WILLFUL

In C. N. Flagg and Co., Inc., d/b/a Northeastern Contracting Co., v. Secretary of Labor, OSHRC Docket No. 1409, February 4, 1975, the Commission reversed this judge's finding of willful violation of the Act. There the Secretary had issued a second citation five days after the initial inspection. The willful violation citation was issued because the employer's supervisor persisted in his assertion that he didn't need to shore a trench all the way to the bottom after having been put on notice after the first inspection that the Secretary considered it to be required by the standards. This superintendent persisted in this attitude while testifying at the hearing. There could be no question about his intention to disregard the requirements of the standard as promulgated and asserted by the Secretary as applicable. However, Commissioners Moran, VaNamee and Cleary were unaminous in reversing this conclusion of this judge in this instance.

In the instant case there is no evidence of intentional, conscious, and deliberate disregard of the standards such as was shown in the Flagg case (supra). Wiseman's justification for his recommendation that a willful violation be charged was that he thought the housekeeping conditions were "deplorable". (Tr. 2, p. 46, L. 12). He also said that he relied to a certain degree on conversation with employees. This no doubt included employees like Jennings and Bamsey who were not only censured for failure to perform their own tasks in disregard of safety regulations but were subsequently fired because of continued violation of company rules.

Wiseman relied chiefly upon employee statements that complaints about inadequate safety practices were ignored by management. However he apparently based his conclusions upon the unreliable word of Jennings and Bamsey, neither of whom is worthy of belief.

It is clear that P and Z was aware of its failure to supply adequate illumination. The evidence adduced by the Respondent itself revealed that their Safety Superintendent Fallon had notified management that he had found some insufficient illumination more than six months before the inspection. P and Z abated the condition which casts doubt upon the Secretary's allegation that there was intentional failure to remedy known deficiencies in lighting. The fact that National Law Control Service Inc. may have discovered safety deficiencies does not show willfulness. There must also be proof that, at sometime, after such notice was received, P and Z intentionally, consciously, and deliberately failed to act.

It is not disputed that two employees accused P and Z of failing to respond to complaints about unsafe working conditions, but these were the same employees who were discharged for repeated violations of P and Z's safety rules and instructions. Their testimony has no probative value.

CONCLUSIONS OF LAW

On the basis of the foregoing findings of fact I make the following conclusions of law.

1. The Respondent, P and Z Company, Inc., did not violate the standards as alleged in Items 1 and 2, Citation No. 1; Citation No. 2; and Citation No. 3, Item No. 1(b), (c), (d), (e), (g), (h), and (i).

2. The Complainant sustained the burden of proof of nonserious violation of the standards as alleged in Items 3 and 4 of Citation No. 1; Item 1(a) and (f) of Citation No. 3 and Citation No. 4.

3. There is an absence of evidence of intentional, knowing and voluntary subjection of employees to risk of injury from accumulated lumber and debris. The Secretary did, however, adduce a preponderance of evidence that an employee work in some form stripping materials inside the "E" Street vent shaft was exposed to a risk of very slight injury for which a penalty of $25 is appropriate.

4. There was inadequate enforcement of the requirement that at least 5 foot candles of light be supplied in all work areas as alleged in Citation No. 4. However, it was partly the result of the failure of affected employees to ask for additional equipment which was available. For that reason a penalty of $50 is considered to be adequate.

ORDER

It is therefore hereby ordered that:

1. Citation No. 1 and the proposed penalty of $50 be vacated.

2. Citation No. 2 and the proposed penalty of $60 be vacated.

3. That Citation No. 1, Item 3 and 4 be affirmed without penalty.

4. That Citation No. 2 and the proposed penalty of $2,000 having been withdrawn by the Secretary be vacated.

5. That Citation No. 3, Item 1(a), (b), (c), (d), (e), (g), (h), and (i) and the proposed penalty of $2,000 be vacated; that Item 1(f) be affirmed and that a penalty of $25 be assessed.

6. That Citation No. 4 be affirmed, and that the penalty be reduced from $2,000 to $50.

| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>GEORGE C. CHRISTOPHER & SON, INC.,<br><br>Respondent. | OSHRC Docket No. 76-647 |

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

A decision of Administrative Law Judge Paul E. Dixon is before the Commission for review under section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). Judge Dixon vacated one subitem and affirmed the remaining items of a citation alleging that Respondent, George C. Christopher & Son, Inc. ("Christopher"), violated section 5(a)(2) of the Act by failing to comply with the machine guarding standards at 29 C.F.R. §§ 1910.212(a)(1) and 1910.212(a)(3)(ii). 1/ A total penalty of $200

---

1/ Sections 1910.212(a)(1) and (a)(3)(ii) provide as follows:

> § 1910.212 General requirements for all machines.
> (a) Machine guarding - (1) Types of guarding.
> One or more methods of machine guarding shall be provided to protect the operator and other employees in the machine area from hazards such as those created by point of operation,

(cont'd)

was assessed. On review, Christopher takes exception to the judge's disposition of all but three subitems of the citation. 2/ We vacate two subitems affirmed by Judge Dixon, but affirm the remainder of the judge's decision for the reasons stated below.

I.

Christopher is an employer engaged in structural steel fabrication at a plant in Wichita, Kansas. Following an inspection at its plant, the Secretary of Labor ("the Secretary") issued to Christopher a citation alleging that, contrary to section 1910.212(a)(1), the nip points and rotating parts of several shears and plate rolls were unguarded, and that, contrary to section 1910.212 (a)(3)(ii), the points of operation of several shears, combination punches and

---

(Footnote 1 cont'd)

> ingoing nip points, rotating parts, flying chips and sparks. Examples of guarding methods are - barrier guards, two-hand tripping devices, electronic safety devices, etc.
>
> * * *
>
> (3) Point of operation guarding.
>
> * * *
>
> (ii) The point of operation of machines whose operation exposes an employee to injury, shall be guarded. The guarding device shall be in conformity with any appropriate standards therefor, or, in the absence of applicable specific standards, shall be so designed and constructed as to prevent the operator from having any part of his body in the danger zone during the operating cycle.

2/ Neither party has taken exception to those parts of the decision in which the judge affirmed subitems 1(b)(2)(c) and 1(b)(2)(d) and vacated subitem 1(b)(3)(d). In addition, there is no compelling public interest warranting Commission consideration of those subitems. Accordingly, the Commission will not review those dispositions. See Water Works Installation Corp., 76 OSAHRC 61/B8, 4 BNA OSHC 1339, 1976-77 CCH OSHD ¶ 20,780 (No. 4136, 1976); Abbott-Sommer, Inc., 76 OSAHRC 21/A2, 3 BNA OSHC 2032, 1975-76 CCH OSHD ¶ 20,428 (No. 9507, 1976).

shears, and ironworkers were unguarded. 3/ Christopher also was cited under section 1910.212(a)(3)(ii) for failure to guard and to put nonslip pads on the pedals used to activate the ironworkers.

The case was decided on a stipulated record. The parties agreed that there were no "positive physical guards" on the points of operation, nip points, and rotating parts of the cited machines. 4/ Christopher had, however, posted signs warning of the dangers of the machines and indicating the proper method of operation. In addition, Christopher had color coded the moving parts, had supplied guards on other portions of the machines, and had conducted a continuing training

---

3/ "Ironworker" is a general term that covers a variety of power tools that punch, shear, notch, cope, and form metals and other materials. Christopher objects to the judge's conclusion that ironworkers are governed by §§ 1910.212(a)(1) and 1910.212(a)(3)(ii) because they are not among the machines listed in § 1910.212(a)(3)(iv), which states:

> The following are some of the machines which usually require point of operation guarding:
>
> (a) Guillotine cutters.
> (b) Shears.
> (c) Alligator shears.
> (d) Power presses.
> (e) Milling machines.
> (f) Power saws.
> (g) Jointers.
> (h) Portable power tools.
> (i) Forming rolls and calendars.

The Commission has held, as Judge Dixon correctly noted, that the standard applies to all machines, regardless of whether they are included in the list. Irvington Moore, Division of U.S. Natural Resources, Inc., 75 OSAHRC 45/A2, 3 BNA OSHC 1018, 1974-75 CCH OSHD ¶ 19,523 (No. 3116, 1975), aff'd, 556 F.2d 431 (9th Cir. 1977). The list indicates only some of the machines that usually require point of operation guarding; the list is illustrative only.

4/ Christopher did not admit in the stipulation that the pedals activating the ironworkers were not guarded or padded. There is no evidence of record, therefore, to support the citations regarding subitems 1(b)(3)(b) and 1(b)(3)(c). Accordingly, these subitems are vacated.

program to inform employees of the proper ways to operate the machines and the dangers they present. All of these steps were stipulated to have "create[d] an awareness of the machine's danger and assist[ed] in the safe operation thereof." It was also stipulated that no employees had been injured from the unguarded portions of the machines during their normal operation over the previous fifteen years.

The parties further stipulated that two of Christopher's vice-presidents and two of its attorneys would have testified that, at a meeting with the Area Director of the Occupational Safety and Health Administration ("OSHA") in Wichita following the inspection, the Area Director stated, with respect to the guarding of ironworkers, that OSHA would "be governed" by the standard set forth in the draft of a standard issued by the American National Standard Institute ("ANSI"), ANSI B11.5-1975, Safety Requirements for the Construction, Care, and Use of Iron Workers. One of Christopher's vice-presidents also would have testified that before the meeting Christopher was not aware of the draft ANSI standard, that it was not available, and that Christopher could have complied with the draft standard before the inspection if it had known of it. A second vice-president would have corroborated part of this testimony.

It was also stipulated that an assistant to one of Christopher's vice-presidents would have testified "that at certain times and under certain conditions certain of [its] machines <u>cannot be guarded</u> because of the nature of the work and type of material being put through said machines." (Emphasis in the original.) Finally, Christopher's vice-president for engineering would have testified that "attempts were made to develop guards which the employer felt might comply with the OSHA requirements but that they proved to be unsatisfactory as they were impractical for the type of work performed by the employer."

II.

Christopher argues that compliance with the cited standards was either impractical or impossible in that use of such guards would have rendered the equipment inoperable for its type of work. Christopher asserts that it complied with paragraph 11.2.1 of ANSI standard Z229.1-1973, Safety Requirements for Shops Fabricating Structural Steel and Steel Plate, 5/ rather than the occupational safety and health standard at 29 C.F.R § 1910.212(a)(3)(ii), because it is impossible to provide the point-of-operation guarding required by the OSHA standard.

Christopher's claim that compliance with ANSI Z229.1 fulfills its obligation under the Act raises the issue of what the phrase "appropriate standards therefor" in section 1910.212(a)(3)(ii) refers to. In order to permit the parties to fully address these issues and a number of collateral issues, the Commission issued an order requesting briefs on those issues.

A review of the origin of section 1910.212(a)(3)(ii) and its promulgation as an OSHA standard is important to an understanding of these matters. The source of 29 C.F.R. § 1910.212(a)(3)(ii) is 41 C.F.R. § 50-204.5(c)(2). 29 C.F.R. § 1910.221. Section 50-204.5(c)(2) was adopted in 1969 by the Secretary

---

5/ The American National Standards Institute ("ANSI") standard at Z229.1, paragraph 11.2.1 provides as follows:

> 11. General Requirements for All Machines and Equipment
>
> * * *
>
> 11.2 Safeguarding Machines and Equipment
>
> 11.2.1 Safeguards. Safeguards (guards or devices) shall be installed and used when the application or manufacturing process requires the operator or any other employee to be in the danger area of the point of operation of the machine. If the application or manufacturing process is such that point-of-operation guarding is impractical, appropriate warning signs shall be used to make all persons aware of the dangers at point of operation.

of Labor under the Walsh-Healey Public Contracts Act, 41 U.S.C. §§ 35-45 ("the Walsh-Healey Act"). 6/ Section 50-204.5(c)(2) ("the Walsh-Healey point of operation guarding standard") has never been amended. It states:

> § 50-204.5 Machine guarding.
>
> * * *
>
> (c) Point of Operation Guarding.
>
> * * *
>
> (2) Where existing standards prepared by organizations listed in § 50-204.2 provide for point of operation guarding such standards shall prevail. Other types of machines for which there are no specific standards, and the operation exposes an employee to injury, the point of operation shall be guarded. The guarding device shall be so designed and constructed so as to prevent the operator from having any part of his body in the danger zone during the operating cycle.

The list of organizations in section 50-204.2(a), which is referred to in section 50-204.5(c)(2), read, after a minor, insubstantial amendment in January of 1970, as follows:

> § 50-204.2 General safety and health standards; incorporation by reference.
>
> (a) Every contractor shall protect the safety and health of his employees by complying with the applicable standards, specifications, and codes developed and published by the following organizations:
>
> American National Standards Institute Incorporated
> National Fire Protection Association.
> American Society of Mechanical Engineers.
> American Society for Testing and Materials.
> United States Governmental Agencies, including by way of illustration the following publications of the indicated agencies:

---

6/ 34 Fed. Reg. 788, 789 (1969)(adoption); 34 Fed. Reg. 2207 (1969)(effective date postponed); 34 Fed. Reg. 7946, 7948 (1969)(new effective date given). The Walsh-Healey Act was passed by Congress in 1936. It requires that no part of a contract with the federal government exceeding $10,000 be performed "under working conditions which are unsanitary or hazardous or dangerous to the health and safety of employees engaged in the performance of said contracts." 41 U.S.C. § 35(e). For a discussion of the Walsh-Healey Act, and the safety and health standards issued under the Walsh-Healey Act, see General Motors Corp., 81 OSAHRC 13/C10, 9 BNA OSHC 1331, 1981 CCH OSHD ¶ 25,202 (No. 79-4478, 1981).

(1) U.S. Department of Labor

Title 29 (CFR):
Part 1501--Safety and Health Regulations for Ship Repairing.
Part 1502--Safety and Health Regulations for Shipbuilding.
Part 1503--Safety and Health Regulations for Shipbreaking.
Part 1504--Safety and Health Regulations for Longshoring.

* * *

34 Fed. Reg. at 788-789; 34 Fed. Reg. at 7947; 35 Fed. Reg. 1015 (1970). Section 50-204.2(a) was later amended. None of the ANSI standards Christopher claims it complied with was in existence while the first version of section 50-204.2(a) existed. ANSI Z229.1-1973 was approved by ANSI on January 18, 1973; ANSI B11.4-1973 was approved on August 16, 1973; and ANSI B11.5-1975 was approved on September 18, 1975.

The Occupational Safety and Health Act was enacted on December 29, 1970, and became effective on April 28, 1971. Section 6(a) of the Act commanded the Secretary of Labor to "promulgate as an occupational safety and health standard any national consensus standard, and any established federal standard, unless he determines that the promulgation of such a standard would not result in improved safety and health for employees." 7/ Section 3(9) of the Act defined a national

---

7/ Section 6(a) of the Act, 29 U.S.C. § 655(a), provides:

> Without regard to chapter 5 of title 5, United States Code or to the other subsections of this section, the Secretary shall, as soon as practicable during the period beginning with the effective date of this Act and ending two years after such date, by rule promulgate as an occupational safety or health standard any national consensus standard, and any established Federal standard, unless he determines that the promulgation of such a standard would not result in improved safety or health for specifically designated employees. In the event of conflict among any such standards, the Secretary shall promulgate the standard which assures the greatest protection of the safety or health of the affected employees.

consensus standard as "any occupational safety and health standard . . . which has been adopted and promulgated by a nationally recognized standards-producing organization. . . ." 8/ Section 3(10) of the Act defined an established federal standard as "any operational occupational safety and health standard established by any agency of the United States and presently in effect, or contained in any Act of Congress in force on the date of enactment of this Act." 9/

On May 29, 1971, the Secretary, acting under the Walsh-Healey Act, amended the Walsh-Healey regulation at section 50-204.2(a) to read in part:

> (a) Every contractor shall protect the safety and health of his employees by complying with the standards described in the subparagraphs of this paragraph whenever a standard

---

8/ Section 3(9) of the Act, 29 U.S.C. § 652(9), provides:

> The term "national consensus standard" means any occupational safety and health standard or modification thereof which (1), has been adopted and promulgated by a nationally recognized standards-producing organization under procedures whereby it can be determined by the Secretary that persons interested and affected by the scope or provisions of the standard have reached substantial agreement on its adoption, (2) was formulated in a manner which afforded an opportunity for diverse views to be considered and (3) has been designated as such a standard by the Secretary, after consultation with other appropriate Federal agencies.

ANSI standards are national consensus standards. See Newport News Shipbuilding & Drydock Co., 9 BNA OSHC 1085, 1088-89, 1980 CCH OSHD ¶ 25,003, pp. 30,889-890 (No. 76-171, 1980), following Noblecraft Industries, Inc. v. Secretary of Labor, 614 F.2d 199, 203 (9th Cir. 1980).

9/ Section 3(10) of the Act, 29 U.S.C. § 652(10), provides:

> The term "established Federal standard" means any operative occupational safety and health standard established by any agency of the United States and presently in effect, or contained in any Act of Congress in force on the date of enactment of this Act.

deals with an occupational safety or health subject or issue involved in the performance of the contract.

Part 1504--Safety and Health Regulations for Longshoring.
Part 1910--Subpart C through Subpart S (national consensus standards).

* * *

36 Fed. Reg. 9868-9869 (1971) (emphasis added). The Secretary replaced the incorporation by reference of private safety and health standards such as ANSI standards with the incorporation by reference of the national consensus standards he had adopted under section 6(a) of the Act and published in Subparts C through S of 29 C.F.R. Part 1910.

On that same day, the Secretary adopted a new Part 1910 of Title 29 of the Code of Federal Regulations. 36 Fed. Reg. 10466 (1971). The new Part 1910 contained occupational safety and health standards adopted under section 6(a) that were either national consensus standards or established federal standards. The Secretary characterized as national consensus standards "those standards in Part 1910 which are standards adopted and promulgated by either the American National Standard Institute ('ANSI') or the National Fire Protection Association ('NFPA')." Id. He characterized as established federal standards those "operative occupational safety and health standards in effect on April 28, 1971, and established by the Department of Labor pursuant to . . . the Walsh-Healey Public Contracts Act, as amended (41 U.S.C. 35)." Id. At 29 C.F.R. § 1910.212(a)(3)(ii), a section in Subpart O of Part 1910, the Secretary promulgated a point of operation guarding standard ("the OSHA point of operation guarding standard") that read as follows:

> (ii) The point of operation of machines whose operation exposes an employee to injury, shall be guarded. The guarding device shall be in conformity with any appropriate standards therefor, or, in the absence of applicable specific standards, shall be so designed and constructed as to prevent the operator from having any part of his body in the danger zone during the operating cycle.

36 Fed. Reg. at 10466, 10632. The source of this standard is 41 C.F.R. § 50-204.5(c)(2). The other point of operation guarding standards adopted in Subpart O of Part 1910 were derived from ANSI standards. 36 Fed. Reg. at 10466. See 29 C.F.R. § 1910.221. 10/

III.

In his response to the request for briefs, the Secretary claims that "any appropriate standards" refers to "applicable specific standards." He argues that the phrase "appropriate standards therefor" is informational and refers employers

---

10/ The section provides:

§ 1910.221 Sources of standards.

The standards contained in this Subpart O are derived from the following sources:

| Section | Source |
|---|---|
| § 1910.212 | -- 41 CFR 50-204.5. |
| § 1910.213 | -- ANSI 01.1-1954 (R1961), Safety Code for Woodworking Machinery. |
| § 1910.214 | -- ANSI 01.1-1954--(R1961), Safety Code for Woodworking Machinery. |
| § 1910.215 | -- ANSI B7.1--1970, Safety Code for Abrasive Wheels. |
| § 1910.216 | -- ANSI B28.1-1967, Safety Code for Mills Calenders in the Rubber and Plastic Industries. |
| § 1910.217 | -- ANSI B11.1-1971, Safety Standard for Construction, Care and Use of Mechanical Power Presses. |
| § 1910.218 | -- ANSI B24.1 1971, Safety Standards for Forging. |
| § 1910.219 | -- ANSI B15.1-1953--(P1958) Safety Code for Mechanical Power Transmission Apparatus. |

to other OSHA point of operation guarding standards that might apply to their machines. If no other OSHA standard applies, then the requirement of section 1910.212(a)(3)(ii) that guarding be so designed and constructed as to prevent the operator from having any part of his body in the danger zone during the operating cycle comes into play. The Secretary relies on the Commission's decision in Kroehler Mfg. Co., 78 OSAHRC 88/B9, 6 BNA OSHC 2045, 1978 CCH OSHD ¶ 23,110 (No. 76-2120, 1978), in which the Commission held that under section 1910.212(a)(3)(ii) an "appropriate standard must be an applicable specific standard." The Secretary also argues that the legislative history of the Walsh-Healey machine guarding standard "makes it clear that the only standards of private organizations which were incorporated by reference into Part 1910 of 29 C.F.R. were specific national consensus standards that were either published in Part 1910 as an OSHA standard . . . or explicitly incorporated by reference in an OSHA standard . . . ." He notes that 41 C.F.R. § 50-204.5(c)(2) referred to 41 C.F.R. § 50-204.2 which in turn referred to standards published by a number of standards producing organizations. However, the Secretary points out that on the same day Part 1910 was published, 41 C.F.R. § 50-204.2 was amended to delete the reference to private standards producing organizations. The Secretary contends that since section 1910.212 derives at least partially from the Walsh-Healey standard, it would be anomalous to suggest that ANSI standards would be incorporated sub silentio into a standard, the source of which had been cleansed of any reference to ANSI. The Secretary also maintains that ANSI Z229.1-1973, the only ANSI standard Christopher mentions that was in effect during the two year period in which the Secretary could adopt ANSI standards under section 6(a) of the Act, was a discretionary rather than a mandatory standard. Promulgation of such a standard would, the Secretary argues, be contrary to section 6(a) of the Act, which requires the Secretary to adopt established federal standards and national

consensus standards unless he determines that such promulgation would not result in improved safety and health for specifically designated employees. In short, the Secretary argues that the phrase "any appropriate standards therefor" does not incorporate any ANSI standards by reference.

In its supplemental brief, Christopher also argues that ANSI standards are not incorporated by reference in the present OSHA standard or in the present Walsh-Healey standard. Christopher points out that neither 29 C.F.R. § 1910.221, which gives the source of 29 C.F.R. § 1910.212(a)(3)(ii) as 41 C.F.R. § 50-204.5(c)(2), nor the present version of 41 C.F.R. § 50-204.2(a) makes any mention of ANSI standards. Christopher also asserts that the reference to "national consensus standards" in the present version of section 50-204.2 fails to identify the material that would be incorporated by reference with the degree of specificity required by 1 C.F.R. §§ 51.6-51.7 and does not indicate the address of organizations from which copies of the standards could be obtained as required by 1 C.F.R. § 51.8(a).

Christopher does take issue with the Secretary's adoption of 29 C.F.R. § 1910.212(a)(3)(ii). Christopher contends that the Secretary failed to adopt 41 C.F.R. § 50-204.5(c)(2) verbatim but made significant changes. In Christopher's view, the language of the Walsh-Healey standard affords an employer a much clearer idea of his duties. It refers to standards published by organizations that provide for point of operation guarding and requires guarding that meets a performance criterion only if none of those organizations has issued specific standards. Christopher argues that in contrast, section 1910.212(a)(3)(ii) does not specifically identify what are "appropriate standards therefor." Christopher contends that this change creates ambiguity and confusion. Relying on Usery v. Kennecott Copper Corp., 577 F.2d 1113 (10th Cir. 1977)("Kennecott"), Christopher contends that the Secretary's failure to promulgate 41 C.F.R. § 50-204.5 verbatim renders the standard unenforceable.

Christopher disagrees with the holding of Rockwell International Corp., 81 OSAHRC 118/A2, 9 BNA OSHC 1092, 1980 CCH OSHD ¶ 24,979 (No. 12470, 1980) ("Rockwell"), that section 1910.212(a)(3)(ii) can be read to convey the same meaning as 41 C.F.R. § 50-204.5(c)(2). Christopher contends, contrary to Rockwell, that the phrase "standards prepared by organizations listed in § 50-204.2" does not mean the same as "appropriate standards therefor." Christopher also questions whether standards can be "appropriate standards" if they were not developed by the organizations listed in section 50-204.2. Christopher suggests that the Secretary may have intended the phrase "standards prepared by organizations listed in § 50-204.2" to mean "specific standards," which in turn was supposed to mean the phrase "appropriate standards therefor." However, Christopher argues that it is not required to guess what the Secretary meant when he promulgated the OSHA standard in the manner he did. 11/

IV.

A.

Section 5(a)(2) of the Occupational Safety and Health Act requires employers to comply with occupational safety and health standards "promulgated under this

---

11/ As a second ground for its contention that the adoption of section 1910.212 (a)(3)(ii) by the Secretary was improper, Christopher argues that section 1910.212(a)(3)(ii) was not derived from an established federal standard as defined in section 3(10) of the Act, note 9 supra. Christopher contends that the phrase "presently in effect" in section 3(10) refers to occupational safety and health standards adopted by an agency and in effect on the date of enactment of the Act, December 29, 1970. Christopher contends that the drafters of the Act intended that the "presently in effect" language referring to agency standards should be read in parallel with the phrase "in force on the date of enactment of the Act" that pertains to congressionally-adopted standards. Christopher therefore argues that by promulgating the Walsh-Healey standards as they read on April 28, 1971, instead of on December 29, 1970, the Secretary did not adopt an established federal standard, and, accordingly, that section 1910.212(a)(3)(ii) is invalid. Christopher apparently is of the view that the Walsh-Healey standards differed on those dates.

Act." Thus, an employer does not necessarily satisfy his duty under section 5(a)(2) by complying with a private standard, such as an ANSI standard, if the private standard has not been adopted as an occupational safety and health standard under the Act. 12/ However, section 1910.212(a)(3)(ii) requires employers to comply with "appropriate standards" for point-of-operation guarding. The question therefore arises whether the ANSI standards Christopher mentions are such standards. In Rockwell, we held that the phrase "any appropriate standards therefor" in the OSHA standard would be interpreted "as referring to the standards prepared by organizations listed in section 50-204.2." 9 BNA OSHC at 1097, 1980 CCH OSHD at p. 30,845. We examined the history of section 1910.212(a)(3)(ii) in light of the principle that in adopting established federal standards under section 6(a) the Secretary could not make substantive changes in them, 13/ and upheld its validity by reading the OSHA standard to be consistent with its Walsh-Healey ancestor. We reserved decision, however, on which version of the list in section 50-204.2(a) would be referred to in applying section 1910.212(a)(3)(ii) because that issue was neither raised by the parties nor necessary to the resolution of that case. The first version of that list incorporates ANSI standards by reference; the second version cross-references OSHA standards, including those in Subparts C through S of Part 1910.

Christopher contends, however, that Rockwell erroneously held that the phrase "appropriate standards therefor" refers to standards prepared by organizations

Dayton Tire & Rubber Co., 80 OSAHRC 95/D4, 8 BNA OSHC 2086, 2091, 1980 CCH OSHD ¶ 24,842, p. 30,638 (No. 16188, 1980)(forthcoming ANSI standard), pet. for rev. filed, No. 80-3755 (6th Cir. Nov. 25, 1980).

13/ Diebold, Inc. v. OSHRC, 585 F.2d 1327, 1332 (6th Cir. 1978); C.R. Burnett & Sons, Inc., 80 OSAHRC 111/A2, 9 BNA OSHC 1009, 1019, 1980 CCH OSHD ¶ 24,964 (No. 78-1103 & 78-1105, 1980).

listed in section 50-204.2(a). We have re-examined Rockwell in light of Christopher's arguments and we agree. 14/

First, when the Secretary adopted section 1910.212(a)(3)(ii), he deleted the express reference in section 50-204.5(c)(2) to the list of organizations in section 50-204.2(a). This signifies that the language of section 1910.212(a)(3)(ii) was intended not to refer employers to the list of organizations in section 50-204.2(a). It also seems quite unlikely that the Secretary would have implicitly referred employers--who were then unfamiliar with the new OSHA standards in Title 29 of the Code of Federal Regulations--to a list of organizations in a different volume of the Code of Federal Regulations. Second, on the same day he adopted section 1910.212(a)(3)(ii), the Secretary also amended the list in section 50-204.2(a) by deleting references to ANSI and other independent standards-producing organizations; thus, the old list would no longer have appeared in future editions of the Code of Federal Regulations. Indeed, on that same day, the Secretary directly adopted under OSHA many of the ANSI standards formerly incorporated by reference in the first version of section 50-204.2(a). These events suggest that the Secretary did not intend to refer employers to the old version of the list.

Third, for the Secretary to have required employers to refer to the old version of the list would have violated the regulations of the Director of the Federal Register that were in effect when the Secretary adopted section 1910.212 (a)(3)(ii). 1 C.F.R. §§ 20.10-20.12 (1971) required an unequivocal statement of incorporation, identification of incorporated material and a statement of the

---

14/ The conclusions reached here in regard to Rockwell concern only the interpretation of section 1910.212(a)(3)(ii) set out there. Our other holdings in that decision, including our holding that the Commission has authority to consider the validity of a standard's promulgation, are not affected.

material's availability. Yet, when section 1910.212(a)(3)(ii) was adopted, section 50-204.2(a) no longer incorporated ANSI standards by reference, Part 50-204 no longer identified and described ANSI standards as matters referred to, and the part did not indicate the availability of the ANSI standards. Requiring employers to refer to the old list would probably have also violated the APA's requirement that "a person may not in any manner be required to resort to, or be adversely affected by, a matter required to be published in the Federal Register and not so published." 5 U.S.C. § 552(a)(1).

Fourth, if the phrase "appropriate standards therefor" in section 1910.212 (a)(3)(ii) is interpreted to refer to the second version of section 50-204.2(a), an employer under the Act would refer to a Walsh-Healey regulation that in turn refers to OSHA standards published alongside section 1910.212. The Secretary cannot possibly have intended such a useless circularity.

We therefore hold that the phrase "any appropriate standards therefor" refers only to "applicable specific standards" 15/ published or incorporated by reference as occupational safety and health standards in Title 29 of the Code of Federal Regulations. We think that it is implicit that only such standards would have been referenced in section 1910.212(a)(3)(ii). It is unlikely, at the least, that the Secretary would have had employers look to standards not published or incorporated by reference as OSHA standards. The holding of Rockwell that "appropriate standards therefor" refers to standards adopted by organizations listed in 41 C.F.R. § 50-204.2 is therefore overruled.

B.

Christopher argues, however, that the OSHA standard is invalid because it is different from its source standard. We are unconvinced.

---

15/ Kroehler Mfg. Co., 78 OSAHRC 88/B9, 6 BNA OSHC 2045, 2046-2047, 1978 CCH OSHD ¶ 23,110, pp. 27,929-930 (No. 76-2120, 1978).

Whether a standard is validly promulgated does not turn on differences in language. The Secretary was not required by section 6(a) of the Act to promulgate national consensus or established federal standards verbatim. Deering-Milliken, Inc. v. OSHRC, 630 F.2d 1094, 1110 (5th Cir. 1980). The proper inquiry is whether the Secretary made a substantive change when he transformed the Walsh-Healey standard into an OSHA standard. See id. The burden of proving that a substantive change was made is on Christopher. See Turner Co., 76 OSAHRC 108/A2, 4 BNA OSHC 1554, 1558, 1976-77 CCH OSHD ¶ 21,023, p. 25,276 (No. 3635, 1976), rev'd on other grounds, 561 F.2d 82 (7th Cir. 1977).

The OSHA point of operation guarding standard, 29 C.F.R. § 1910.212(a)(3)(ii), requires that an employer comply with applicable point of operation guarding standards published in Part 1910 or, if there are none, with the general performance criterion. The source of section 1910.212(a)(3)(ii), 41 C.F.R. § 50-204.5(c)(2), required compliance with point of operation guarding standards published by organizations listed in section 50-204.2(a), or if none of those standards applied, with a general performance criterion identical to that in section 1910.212(3)(ii). The issue is therefore whether Christopher has shown that a point of operation guarding standard incorporated by reference in section 50-204.2(a) was not adopted under the Occupational Safety and Health Act.

Our consideration is, however, confined to the first version of the list of organizations in section 50-204.2(a). Section 3(10) permitted the Secretary to adopt only those federal standards "presently in effect." Yet, only the first version of the list was in effect on both the Act's date of enactment, December 29, 1970, and effective date, April 28, 1971. Moreover, the Secretary stated that the established federal standards he adopted were those in effect on April 28, 1971. 36 Fed. Reg. 10466 (1971). Therefore, we will look to 41 C.F.R. §§ 50-204.

2(a) and 50-204.5(c)(2), and the standards they incorporated by reference as they stood no later than April 28, 1971. 16/

Christopher has not, however, directed us to any point of operation guarding standard that was then incorporated by reference in the first version of section 50-204.2(a). The ANSI standards Christopher does bring to our attention were not then in existence. 17/ Accordingly, we conclude that Christopher has failed to show that the standard is invalid because a substantive change was made.

Christopher also argues that in varying section 1910.212(a)(3)(ii) from its source, the Secretary created ambiguity and confusion because he did not clearly identify which standards were "appropriate standards therefor." When Christopher was cited for failing to comply with section 1910.212(a)(3)(ii), we had not defined "appropriate standards therefor" as clearly as we do here. However, we note that Christopher did not indicate any confusion concerning "appropriate standards" in its brief to the judge. In that brief, which it adopted as part of its brief before the Commission, Christopher stated that:

> The Occupational Safety and Health Administration has failed to adopt any "specific standards" relating to the particular type of machines involved in this Complaint. A literal reading of the alternative requirement set forth above clearly

---

16/ Because the Walsh-Healey regulations were identical on both the date of enactment of the Act and the Act's effective date, it is unnecessary to decide here which of those dates "presently in effect" refers to. We also do not decide here whether standards adopted by ANSI after the publication of the first version of the list in § 50-204.2(a) were incorporated by reference under the Walsh-Healey regulations.

17/ The Commission attempted to discover whether there were any point of operation guarding standards incorporated by reference in the first version of § 50-204.2 that had not been promulgated as OSHA standards under section 6(a) of the Act. Although we conducted an extensive search, we were unable to discover any such standards. Because the burden of proof is on the employer, and Christopher has failed to bring any such standard to our attention, we can only conclude for the purposes of this case that there are no such standards.

> indicates that positive guards completely restricting the machine operator from any reasonable possibility of accident are necessary.

Thus, Christopher knew what "appropriate standards therefor" meant and recognized that none existed for its machines.

V.

In order to prove noncompliance with 29 C.F.R. § 1910.212(a)(3)(ii), the Secretary must demonstrate that the point of operation is unguarded and that the operation of the machine exposes an employee to injury. See Hughes Brothers, Inc., 78 OSAHRC 65/A2, 6 BNA OSHC 1830, 1978 CCH OSHD ¶ 22,909 (No. 12523, 1978). To prove noncompliance with section 1910.212(a)(1) as to Christopher, the Secretary must show that employees in the machine area were not protected from hazards created by ingoing nip points and rotating parts. Christopher does not argue on review that the points of operation did not expose employees to injury or that the nip points and rotating parts were not hazardous. Christopher has taken no exception to the judge's findings on the point, 18/ but claims that the use of awareness barriers under ANSI Z229.1-1973 constitutes compliance with sections 1910.212(a)(1) and 1910.212(a)(3)(ii). Christopher points to a record of no injuries for fifteen years as an indication that awareness guarding meets the requirements of the standard. Christopher also contends that awareness guarding is the only type of guarding possible for its machines because the guarding required by the standard would render the machines inoperable.

The cited machines lacked the guarding devices required by the standards. 19/ As we concluded earlier, ANSI Z229.1-1973 is not applicable under the Act.

---

18/ Judge Dixon found, from the description of the machines in the stipulations and the photographs, that during their operation the dies could amputate or crush the arms, hands and fingers of Christopher's employees.

19/ Christopher also contends that the punching stations on its ironworkers are equipped with strippers that serve as adjustable restrictors and comply with section 1910.212(a)(3)(ii). There is no mention in the stipulated record of the existence of the strippers or of their adequacy as guards.

Christopher's reliance on "awareness barriers," which depend upon employee behavior for protection, is misplaced. The standards require that guarding be provided by a device that itself prevents the operator from endangering himself. They do not permit an employer to depend instead on the skill or attentiveness of his employees. Hughes Brothers, Inc., 6 BNA OSHC at 1834, 1978 CCH OSHD at p. 27,718. The absence of a history of injury does not relieve an employer of his duty under the standards to prevent future injuries if, as here, there are hazards to which employees are exposed. See A.E. Burgess Leather Company, Inc., 77 OSAHRC 25/D6, 5 BNA OSHC 1096, 1977-78 CCH OSHD ¶ 21,573 (No. 12501, 1977), aff'd, 576 F.2d 948 (1st Cir. 1978). We therefore find that Christopher did not comply with sections 1910.212(a)(1) and 1910.212(a)(3)(ii). We now turn to whether Christopher has established an affirmative defense.

In order to establish the affirmative defense of impossibility of compliance, an employer must demonstrate that (1) compliance with the standard would preclude performance of required work and (2) alternative means of protection are unavailable. M.J. Lee Construction Co., 79 OSHARC 12/A2, 7 BNA OSHC 1140, 1979 CCH OSHD ¶ 23,330 (No. 15094, 1979). Whether it is impractical to provide guarding is not the inquiry. Hughes Brothers, Inc., 6 BNA at 1836, 1978 CCH OSHD at p. 27,720. The only evidence in the stipulated record is that "certain" unnamed machines under "certain" unspecified conditions could not be guarded because of the nature of the work for which the machines were used. This furnishes insufficient ground to find impossibility for we would have no basis to know which citation items to vacate and which to affirm. We therefore conclude that Christopher has failed to prove the first element of the defense of impossibility.

Christopher further contends, regarding this defense, that the area director agreed that it was impossible to guard the cited machines with positive physical

guards. The stipulated record does not indicate such a concession by the area director, however. Christopher also contends that the area director stated that OSHA would be governed by the "awareness barrier" guarding procedures as set forth in the draft in ANSI B11.5. However, because the area director's statement was made after the violations are alleged to have occurred, Christopher could not have relied on that statement to its detriment. See Bethlehem Steel Corp., OSHRC Docket No. 16067 (December 31, 1981). 20/

Christopher contends that section 1910.212 is vague because it does not specify an approved method of guarding. It states that it therefore relied on the ANSI standards for guidance as to what methods of guarding would meet the Secretary's requirements. Judge Dixon found this assertion unpersuasive, noting that the standard gives examples of guarding methods and thus provides guidelines for employers. 21/

The Commission has repeatedly rejected the argument that the performance criterion of section 1910.212(a)(3)(ii) is unenforceably vague. See, e.g., Diebold, Inc., 76 OSAHRC 3/E5, 3 BNA OSHC 1897, 1900, 1975-76 CCH OSHD ¶ 20,333, p. 24,250 (No. 6767, 1976), rev'd on other grounds, 585 F.2d 1327 (6th Cir. 1978); 22/ K & T Steel Corp., 76 OSAHRC 31/A2, 3 BNA OSHC 2026, 2027, 1975-76 CCH OSHD

---

20/ Commissioner Cottine concurs regarding the impossibility of reliance in this case. However, he would further note that an erroneous interpretation of law by an area director is not binding on the Secretary or the Commission. See United States Steel Corp., 77 OSAHRC 12/C3, 2 BNA OSHC 1343, 1974-75 CCH OSHD ¶ 19,047 (Nos. 2975 and 4349, 1974), appeal dismissed, 517 F.2d 1400 (3d Cir. 1975). See also Holman Erection Co., Inc., 77 OSAHRC 196/A2, 5 BNA OSHC 2078, 1977-78 CCH OSHD ¶ 22,318 (No. 13529, 1977).

21/ See note 1 supra.

22/ The Sixth Circuit held in Diebold that the standard at 29 C.F.R. § 1910.212 standing alone was not impermissibly vague, and that the standard was vague

(cont'd)

¶ 20,445, p. 24,414 (No. 5769, 1976). On the contrary, the criterion is unequivocal: the guarding device must prevent the operator from having any part of his body in the danger zone during the operating cycle. Section 1910.212(a)(1) is similarly unambiguous: employees must be protected from the hazards of nip points and rotating parts. See PBR, Inc. v. Secretary of Labor, 643 F.2d 890, 897 (1st Cir. 1981). An employer can easily tell from the performance criteria of these standards whether his machines are in compliance, and indeed Christopher has labored under no uncertainties on this point. Christopher's problem is not uncertainty over whether it is in compliance--it knows that it is not--but the difficulty of compliance, a matter that goes to the defense of impossibility. A standard is not impermissibly vague because an employer must exercise judgment in determining how its requirements are to be met. See Western Waterproofing Co., 78 OSAHRC 68/D11, 7 BNA OSHC 1625, 1629, 1979 CCH OSHD ¶ 23,785, pp. 28,862-3 (No. 1087, 1979). Sections 1910.212(a)(1) and 1910.212(a)(3)(ii) give sufficient notice of the performance required.

Christopher also argues that, because of the alleged vagueness of the standards, it lacked knowledge of the "presence of the violation" within the meaning of section 17(k) of the Act. It argues that it neither knew nor could have known with the exercise of reasonable diligence that its use of warning signs and safety training to guard the machines did not abate the violative conditions. This argument lacks merit. As we have said above, the standards are not

---

(Footnote 22 cont'd)

only when it was applied to press brakes and read in conjunction with § 1910.217. The Court's holding concerning press brakes is not relevant to this case.

In the last sentence of § 6(b)(5) of the Act, 29 U.S.C. § 655(b)(5), Congress required the Secretary to use performance criteria for health standards "[w]henever practicable." On the value of performance criteria to employers, see the Commission decision in Diebold, 3 BNA OSHC at 1900, 1975-76 CCH OSHD at p. 24,250.

vague; as Christopher acknowledges, they require more than warning signs and safety training. It is also well settled that the knowledge element of section 17(k) of the Act refers to knowledge of the physical conditions that constitute a violation, not to knowledge of the requirements of the law. Charles A. Gaetano Construction Corp., 78 OSAHRC 24/A2, 6 BNA OSHC 1463, 1465 n.3, 1978 CCH OSHD ¶ 22,630, p. 27,303 n.3 (No. 14886, 1978).

VI.

Christopher's final contention is that the violation should be characterized as nonserious rather than serious. In support of this argument, Christopher cites several Commission decisions in which similar violations were cited as nonserious by the Secretary. The Commission has held that the Secretary's characterization of a violation in another case is not controlling in a case before the Commission. See Fleming Foods of Nebraska, Inc., 77 OSAHRC 196/C12, 6 BNA OSHC 1233, 1978 CCH OSHD ¶ 22,889 (No. 14484, 1977).

Christopher further relies on language in the Secretary's Field Operations Manual to support its contention that should violations exist in this case, they are nonserious. The Manual at one time provided a definition of "substantial probability" that would have made a violation serious only if, among other things, industry experience indicated that death or serious physical harm would result from an accident caused by a violative condition. The Commission has held that the guidelines provided by the Manual do not have the force and effect of law, nor do they accord important procedural or substantive rights to individuals. See FMC Corporation, 77 OSAHRC 153/D4, 5 BNA OSHC 1707, 1977-78 CCH OSHD ¶ 22,060 (No. 13155, 1977). Accordingly, any variance from the instructions in the Manual by the Secretary is not a basis for changing the characterization of a violation.

In addition, Christopher's reliance on its accident-free record as evidence of the nonserious nature of the violation is misplaced. The probability that an

accident might occur is not a consideration in determining the seriousness of a violation. Instead, the inquiry is whether, in the event of an accident, there is a substantial probability that the result would be death or serious physical harm. California Stevedore & Ballast Co., 73 OSAHRC 39/B5, 1 BNA OSHC 1305, 1974-74 CCH OSHD ¶ 16,520 (No. 14, 1973), aff'd, 517 F.2d 986 (9th Cir. 1975).

There was no agreement between the parties as to what the probable injuries would be if an accident occurred on the cited machines. The injuries that Judge Dixon found would be caused are serious, however. It was also stipulated that the compliance officer who inspected the worksite recommended that the citation be characterized as serious, but there is no indication as to what the testimony of any of Christopher's witnesses would have been regarding the probable consequences of an accident. The parties stipulated that the photographs of the machines that were admitted accurately represent conditions at the plant on the day of inspection. The photographs show that the machines are used to form, punch, and perform other shaping and cutting operations on metal. We therefore find that there was a substantial probability that serious physical injury, such as amputation or crushing, could have resulted from the violative conditions.

Although we do not take into account the probability that an accident might occur in determining the seriousness of a violation, it is a factor in deciding the gravity and, in turn, the appropriate penalty. Judge Dixon assessed a penalty of $200, instead of the $600 proposed by the Secretary. The gravity of the violation is low, as evidenced by the absence of injuries in the past fifteen years and the partial protection afforded by the warning signs and respondent's safety training program. We take into consideration these factors as well as Christopher's good faith efforts to protect its employees, and conclude that the reduced penalty of $200 is appropriate.

Finally, we note that while ANSI B11.4-1973 and B11.5-1975 are not OSHA standards, they may nevertheless be used to guide Christopher's abatement efforts,

particularly in view of the Secretary's stipulation that under certain conditions some of Christopher's machines cannot be guarded. On June 30, 1981, OSHA issued an enforcement directive concerning ironworkers, OSHA Instruction STD 1-12.27, 1 BNA OSHR Reference File 21:8259, 1980-81 CCH Emp. S. & H. Guide Developments ¶ 12,274 (1980). The directive stated that "29 C.F.R. § 1910.212 [was] the appropriate standard to apply to ironworker machines . . . [but that] ANSI B11.5-1975 should be consulted when considering a citation under § 1910.212 . . . on an ironworker machine . . . [because it] provide[s] useful guidance in evaluating and correcting ironworker hazards." Similarly, on February 23, 1981, OSHA issued an enforcement directive concerning metal cutting shears, OSHA Instruction STD 1-12.25, 1 BNA OSHR Reference File 21:8256, 1980-81 CCH Emp. S. & H. Guide Developments ¶ 12,219 (1980). The directive orders OSHA officials to accept awareness barrier guards specified in ANSI B11.4 on metal cutting shears where "it is impossible to employ a fixed guard or point of operation device due to the diversity of operations performed on the shear." While we must reject Christopher's impossibility defense because this record does not support it, we will, under the unusual circumstances of this case, exercise our discretionary authority under section 10(c) of the Act, 29 U.S.C. § 659(c), to grant "other appropriate relief." We shall therefore order the parties to confer on what abatement steps would be acceptable in light of these directives.

Accordingly, the judge's decision is reversed with respect to subitems 1(b)(3)(b) and 1(b)(3)(c), alleging failure to guard and pad the pedals on the ironworkers, and these subitems are vacated. The remainder of his decision is affirmed to the extent it is consistent with this opinion. A penalty of $200 is assessed. The parties are directed to exchange information on the difficulty of

compliance, and to confer within thirty days on what abatement steps would be acceptable for the cited machines in light of OSHA Instructions STD 1-12.25 and 1-12.27.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: FEB 26 1982

ROWLAND, Chairman, concurring in part:

I join in the majority's opinion except with respect to its discussion of the subitems alleging violations of 29 C.F.R. § 1910.212(a)(1), i.e., subitems (a)(1)(a)-(d), (a)(2)(a)-(b), and (a)(3)(a)-(b) of item 1 of serious citation 2. I would affirm these violations but for different reasons.

I agree with the majority's view that section 1910.212(a)(1) is not vague because its plain language puts employers on fair notice that they must provide guarding methods for nip points and rotating parts that will protect employees. I think that employers generally appreciate the hazards posed by nip points and rotating parts and will ordinarily recognize whether the guarding methods they employ protect their employees.

However, in concluding that section 1910.212(a)(1) is not vague, my colleagues rely on PBR, Inc. v. Secretary of Labor, 643 F.2d 890 (1st Cir. 1981). That decision, as well as the decision it cites, A.E. Burgess Leather Co. v. OSHRC, 576 F.2d 948, 951 (1st Cir. 1978), concerned point-of-operation guarding and construed section 1910.212(a)(1) in light of the specific point-of-operation standard, section 1910.212(a)(3)(ii). But Christopher has been cited under section 1910.212(a)(1) with respect to nip points and rotating parts--not points of operation. I cannot agree that, at least with respect to nip points and rotating points, the requirement of section 1910.212(a)(1) ought to be construed together with that of section 1910.212(a)(3)(ii). In order to guard nip points and rotating parts under section 1910.212(a)(1), an employer is required to provide "one or more methods of machine guarding . . . to protect the operator and other employees in the machine area." Section 1910.212(a)(3)(ii) on the other hand imposes a more specific requirement that addresses only the problem posed by points of operation. It requires guarding that will "prevent the operator from having any part of his body in the danger zone during

the operating cycle." It therefore cannot be said that the guarding required to protect against rotating parts and nip points under section 1910.212(a)(1) is necessarily that required for points of operation by section 1910.212(a)(3)(ii).

For this same reason, it also does not follow that rotating parts and nip points must be protected, as the Commission holds, "by a device that itself prevents the operator from endangering himself"; nor can I join the implication in the lead opinion that section 1910.212(a)(1) requires "positive physical guards." The standard requires only that one or more methods of machine guarding be provided to "protect" the operator and other employees from the hazards of nip points and rotating parts. It therefore ought to be enough to say that the employees were not protected against hazards of nip points and rotating parts. It has not been disputed before the judge or before the Commission that hazards existed or that the machines lacked guards meeting the standard's requirement. The record was stipulated, and these matters have not been a point of controversy. Indeed, the focus of controversy has been elsewhere. See Commission Rule 92(d), 29 C.F.R. § 2200.92(d)(issues ordinarily limited to those raised before the judge). For these reasons, I concur.

UNITED STATES OF AMERICA

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR,<br><br>Complainant<br><br>v.<br><br>GEO. C. CHRISTOPHER & SON, INC.,<br><br>Respondent | OSHRC DOCKET 76-647 |

REPRESENTING COMPLAINANT:

JAMES M. CLEETON, ESQ., Office of the Solicitor, U. S. Department of Labor, 911 Walnut Street, Kansas City, Missouri

REPRESENTING RESPONDENT:

H. ALLAN CALDWELL, ESQ., Arn, Mullins, Unruh, Kuhn & Wilson, 300 West Douglas, Wichita, Kansas

Cause submitted upon agreed stipulation of facts and exhibits.

J-17

Paul E. Dixon, Judge:

This is an action under section 10(c) of the Occupational Safety & Health Act of 1970, 29 USC 651, et seq. (hereinafter referred to as the Act), as a result of an inspection conducted December 3-9, 1975, at respondent's worksite at 1220 Blaine, Wichita, Kansas, where respondent was engaged in the business of structural steel fabrication.

Respondent was originally issued citation 1 for non-serious violation, citation 2 and citation 3 for serious violation, and a notification of proposed penalty on December 23, 1975.

Those citations and notification of proposed penalty were received by respondent on December 29, 1975.

On January 6, 1976, an amended citation 1 was issued, which extended certain of the abatement dates, and on January 15, 1976, citation 2 for serious violation was amended to change certain of the abatement dates in the citation and to add part (b)(3) to citation 2.

On the same date, citation 3 for serious violation, and the proposed penalty therefor, was deleted and was received by respondent on January 19, 1976.

On February 9, 1976, respondent filed its notice of intent to contest citation 2 for serious violation as amended, and the notification of proposed penalty therefor, pursuant to section 10(c) of the Act.

The respondent's notice of contest did not place in issue

citation 1 for non-serious violation, as amended, or the penalty proposed therefor in the amount of $85.00.

Complaint was filed on the 27th day of February, 1976, with respondent answering on the 15th day of March, 1976, and the case was at issue.

THE CITATION
Citation 2 for Serious Violation

29 CFR 1910.212(a)(1)

"(a) One or more methods of machine guarding was not provided to protect the operator and other employees in the machine areas from hazards such as those created by point of operation, ingoing nip points and rotating parts on the following named and located equipment:

(1) The openings between the bed and the hold down pads were such, on the shears, so as to permit employees to inadvertently place their fingers and/or hands into the danger zone during the operating cycle:

(a) The Steelweld 5/8 inch shears, #M-6230, located in bay 5, Warehouse and Shear building.

(b) The Cincinnati 3/8 inch shears, #36588, located in the Main building, north side.

(c) The Cincinnati 3/8 inch shears #30267, located in bay 5, Warehouse and Shear building.

(d) The Cincinnati 1 inch shears, #32982, located in bay 6, Warehouse and Shear building.

(2) Operator's fingers, hands and/or arms were exposed to injury created by the ingoing rolls on the following:

(a) The front side (operator's position) and the rear side, when the table guard is removed on the small 5 foot plate roll located in the center of shop, Main building.

(b) The front and rear sides of the Kling, 11 foot roll located in the center shop, Main building, north side.

(3) No guards or devices were provided which would prevent the employees from injury created by the downward movement of the back guages located in the rear of the following:

(a) Cincinnati 3/8 inch shear, #36588, located in the Main building, north side.

(b) Cincinnati 1 inch shear #32982, located in bay 6, Warehouse and Shear building.

29 CFR 1910.212(a)(3)(ii)

(b) The point of operation of the following named and located equipment whose operation exposes an employee to serious injury was not guarded by a device so constructed and designed as to prevent the operator from having any part of his body in the danger zone during the operating cycle:

(1) Fingers and/or hands are exposed to injury created by the blade on the:

(a) Cincinnati 1 inch shear #32982, located in bay 6, Warehouse and Shear building.

(b) Cincinnati 3/8 inch shear, #36588, located in the Main building, north side.

(c) Steelweld 5/8 inch shear, #M-6230, located in bay 5, Warehouse and Shear building.

(d) Cincinnati 3/8 inch shear #30267, located in bay 5, Warehouse and Shear building.

(2) The opening between the bed and the blade and/or punch exposed operator's fingers to injury during operation on the following:

(a) Shear station on the Eclipse Combination punch and shear (no identification number), located in bay 4A in the north building.

(b) Rear side of the Kling angle shear, located in the center of shop, Main building.

(c) The guard was inadequate on the alligator shear (no identification number) located in bay 6A in the north building in that the operator could reach around the guard and inadvertently contact the danger zone with his fingers.

(d) Front and rear sides of the Long and All Statter shear located in bay 6A in the North Building.

(e) Shear station on the Eclipse small combination punch and shear (no identification number) located in the center of Main Building west end.

(d) Punch station on the Eclipse small combination punch and shear (no identification number) located in bay 4A in the north building.

(3) The 220-volts Cleveland mechanical power presses #1 and #2, located in the Main building, near the center, south side; and the cleveland mechanical power press #3, located in the Main Building, near the center, north side, exposed the operator and other employees in the machine area to serious injury due to the following unsafe conditions:

(a) Operator's fingers were exposed to injury in that no point of operation guards or properly applied and adjusted point of operation devices were provided on the Cleveland #1 and #2 power presses.

(b) The pedal mechanisms were not protected to prevent unintended operation from falling or moving objects or by accidental stepping onto the pedal on the Cleveland power presses #1, #2 and #3.

(c) A pad with a nonslip contact area was not firmly attached to the pedals on the Cleveland power presses #1, #2 and #3.

(d) No program of periodic and regular inspections of power presses was established and followed to insure that all their parts, auxiliary equipment and safe guards are in safe operating condition and adjustment and records of inspections and maintenance work performed was not being maintained in the establishment."

A penalty in the amount of $600.00 was proposed.

## THE STANDARDS

### 29 CFR 1910.212(a)(1)

"1910.212--General Requirements for All Machines
(a) Machine guarding.
(1) Types of guarding. One or more methods of machine guarding shall be provided to protect the operator and other employees in the machine area from hazards such as those created by point of operation, ingoing nip points, rotating parts, flying chips and sparks. Examples of guarding methods are--barrier guards, two-hand tripping devices, electronic safety devices, etc."

### 29 CFR 1910.212(a)(3)(ii)

"1910.212--General Requirements for All Machines
(a) Machine guarding.
(3) Point of operation guarding.
(ii) The point of operation of machines whose operation exposes an employee to injury, shall be guarded. The guarding device shall be in conformity with any appropriate standards therefor, or, in the absence of applicable specific standards, shall be so designed and constructed as to prevent the operator from having any part of his body in the danger zone during the operating cycle."

## STIPULATION OF FACTS AND EXHIBITS

"In addition to those matters already agreed to in the pleadings, it is hereby stipulated by and between the parties named above as follows:

1. That George C. Christopher II, Executive Vice President of Geo. C. Christopher & Son; Monty Angulo, Executive Vice President of Geo. C. Christopher & Son, Inc.; and Edward F. Arn and Allan Caldwell of Arn, Mullins, Unruh, Kuhn & Wilson, attorneys for Geo. C. Christopher & Son, Inc. were all present at an informal meeting between the respondent and the Area Director of OSHA,

Roger A. Clark, on the 6th day of January, 1976, and if they were to testify as to the events which took place at that meeting or the statements made by the parties at that meeting, their testimony would be substantially as follows:

> That at that informal meeting the Area Director of OSHA, Roger A. Clark, stated that OSHA would be governed by the standards as set forth in ANSI Standard B11.5 (draft) as they relate to 'iron workers'. That on the same date the Area Director delivered to George C. Christopher II, ANSI Standard B11.5 (draft) which sets forth the safety requirements for the construction, safeguarding, care and use of iron workers for the respondent's information and copying.

2. That the machines listed in Items 1(b)(3) characterized as 'power presses' are not 'power presses' but are 'iron workers' and that this change in designation was agreed to by the local Area Director, Roger A. Clark, at a January 15, 1976 informal meeting with the respondent.

3. That regular safety inspections are conducted of the entire premises of the respondent and all machines contained therein with written reports of said inspections being prepared and filed by the inspector, James L. Nickel, Senior Engineer for the American Mutual Liability Company. That there are regular safety meetings of key employees and management wherein safety measures and requirements are discussed of which written reports are also prepared and filed.

4. That it is a standard operating procedure for all employees of the respondent to conduct a visual inspection of machinery prior to its use and to perform minor maintenance thereon, and to report any maintenance required which can not be immediately performed by the operator to the plant manager or superior for his action.

5. Respondent admits the allegations of paragraph V of complainant's complaint in that respondent admits that on the day of complainant's

inspection there were no positive physical guards placed at the point of operation, at the ingoing nip points or at the rotating points on respondent's machinery which respondent's employees use as set out in that paragraph. There were, however, warning signs as to the dangers of the machines and the proper operation thereof, an active and ongoing training program whereby employees/operators of the machines are informed of their operating processes and the dangers involved therein, color coding of the machine's moving parts, and positive guards on other portions of the machines other than the point of operation, all of which create an awareness of the machine's danger and assist in the safe operation thereof. Respondent contends that these procedures were a substitute for placing actual physical guards at the point of operation on the machines. Respondent and complainant agree that the photographs included herewith are true and accurate representations of the conditions in respondent's establishment on the day of complainant's inspection.

6. That there were no persons or employees of respondent injured at the time and place of the alleged violations...Nor have there been any such injuries from the cited portions of the machines involved in this complaint during their normal operation over a period of the past fifteen (15) years.

7. That the respondent has never been previously cited or charged with any violation of any laws or regulations affecting health or safety of its employees.

8. That the individuals, officers and employees of the respondent who were designated as witnesses in the scheduled hearing of this matter were acting within the scope of their authority on the date of the inspection and dates prior thereto as necessary and would testify as indicated in respondent's pretrial submissions.

9. That James L. Nickel as the Senior Engineer for American Mutual Liability Company and the preparer of certain reports of safety and inspection submitted as evidence in this case acted within the scope of his authority, when conducting

inspections of respondent's plant.

10. That if George C. Christopher II were to testify as to the capability of Geo. C. Christopher & Son, Inc. to comply with ANSI Standard B11.5 (draft) his statement would be substantially as follows:

> That if Geo. C. Christopher & Son, Inc. had known of ANSI Standard B11.5 (draft) and its acceptance by OSHA as a guide for guarding 'iron workers', it could have complied therewith prior to the inspection as it did after being made aware of the existence of said Standard and its acceptance by OSHA thereafter.

11. That the copies of all documents forwarded to complainant as set forth in respondent's pretrial submissions are true and correct copies of the originals thereof.

12. That Stephen R. Frye, the Compliance officer who conducted the inspection of respondent has had 2-1/2 years of experience with the Occupational Safety and Health Administration. Prior to that, he was a safety inspector for seven years for Mason and Hanger-Silas Mason Company, Inc. He worked for 1-1/2 years as a machinist for the J. I. Case Company. He has completed the Basic Course for OSHA Compliance Officers. Other training includes courses in hazardous materials, compressed gasses, accident investigation, respirator training, industrial health and hygiene, radiological studies, medical self-help, emergency radiological monitoring, communications, and munitions saftery [sic]. He studied mathematics at S. E. Iowa Community College. That he recommended that the citation resulting from his inspection of respondent's plant be characterized as serious. He computed the penalties proposed in this case, basing his computations on his background and on what he observed or otherwise ascertained on his inspection. His computations are attached hereto.

13. Pursuant to 29 CFR 2200.36 the respective parties hereto may include in their briefs their respective 'Statements of Position' with respect to any or all issues to be considered by the Administrative Judge."

Additional submissions consisted of proposed penalty assessment worksheet and 30 photographs keyed to subitems of citation 2 of the machinery involved.

## DISCUSSION

### Alleged Violation of 29 CFR 1910.212(a)(1)

Citation 2, item 1(a)(1), involved four shears, one a Steelweld and three Cincinnati, wherein it is charged that the machines were not equipped with machine guarding to protect either the operator or other employees from hazards presented by point of operation, ingoing nip points and rotating parts.

Citation 2, item 1(a)(2), involved ingoing rolls on (a)) the front and rear side of a 5-foot plate roll and (b) the front and rear sides of a Kling 11-foot roll.

Citation 2, item 1(a)(3), involved two Cincinnati shears with no guards or devices provided to protect employees from the downward movement of the back guages.

### Alleged Violation of 29 CFR 1910.212(a)(3)(ii)

Citation 2, item 1(b)(1), described the failure of guarding to prevent employee and operator exposure on (a) a Cincinnati shear; (b) a Cincinnati shear; (c) a Steelweld shear; and, (d) a Cincinnati shear.

Citation 2, item 1(b)(2), alleges opening between the bed and blade and/or punch exposing operator's fingers to injury, which was unguarded on (a) the shear station on an Eclipse Combination

punch and shear; (b) a Kling angle shear; (c) an alligator shear; (d) front and rear sides of a Long and All Statter shear; (e) shear station on an Eclipse combination punch and shear; and, (f) the punch station on an Eclipse combination punch and shear.

Citation 2, item 1(b)(3), involved Cleveland mechanical power presses 1, 2 and 3 as exposing operators and employees to injury due to (a) no point of operation guards or adjusted point of operation devices on Cleveland power presses 1 and 2; (b) unguarded pedal mechanisms on Cleveland power presses 1, 2 and 3; (c) failure to have a nonslip contact pad on the pedals of the three Cleveland power presses; and, (d) no program of periodic and regular inspections of power presses was established to insure that their parts, auxiliary equipment and safe guards are in safe operating condition and adjustments, with lack of records of inspection and maintenance work performed being maintained.

As to the machines charged in 29 CFR 1910.212, the respondent in its answer and stipulation of facts admitted that the machines were not physically guarded at their respective danger zones.

The photographs jointly submitted demonstrate both access and exposure of operators and employees to ingoing nip points, ingoing rolls, shear blades, punch and shear mechanisms; so too, with machinery listed as being in violation of 29 CFR 1910.212(a)(3)(ii).

It does not require expert testimony to adduce from the evidence of record, including photographs of the machines' operators in position, to note that the operators are in extreme close

proximity to a hazardous zone and should they encounter such an operation the injury would be either amputation or crushing.

Respondent, in its brief, raises several points that must be discussed.

Respondent takes the position that positive guards are unreasonable and impossible to provide in order to allow it to do its work, arguing that it is given no guidelines as to what types of guards are required, and further arguing that based upon American National Standards Institute (ANSI) publications, B11.4, regarding the care and use of shears; B11.3, regarding the care and use of power press brakes; and, B11.5, the care and use of iron workers, respondent has a three-year grace period to bring its equipment into compliance.

As to the defense of the ANSI standards, it is noted that these standards are non-operational, and that until duly promulgated in the Federal Register and adopted by the Code of Federal Regulations, the Writer must be governed by the standard as written and its interpretation by the Review Commission.

It is further noted that any administrative determination made by the Area Director is not binding on the Government and cannot be made in derogation of a duly promulgated and established standard.

Guidelines are specifically specified at 29 CFR 1910.212(a), wherein there is enumerated guarding methods of barrier guards, two-hand tripping devices, and electronic safety devices.

Further, the applicability of 29 CFR 1910.212, wherein (a)(3)(ii)

is expanded by subparagraph (iv), wherein it states:

> "The following are some of the machines which usually require point of operation guarding:
> (a) Guillotine cutters.
> (b) Shears.
> (c) Alligator shears.
> (d) Power presses.
> (e) Milling machines.
> (f) Power saws.
> (g) Jointers.
> (h) Portable power tools.
> (i) Forming rolls and calenders."

Clearly, the standard encompasses each and every machine contemplated in the citation without exception.

Respondent makes further argument that at the time of inspection, December 3-9, 1975, OSHA had no specific standards relating to the machines involved, and the only guidelines respondent had were those of ANSI standards B11.5 and Z229.1.

This posture is untenable, in that OSHA came into existence in December of 1970 and 29 CFR 1910.212, which was derived from 41 CFR 50-204.5, had an effective date of February 15, 1972, approximately three years and 10 months prior to respondent's inspection.

Respondent cannot defend upon its lack of diligence in apprising itself of legislation and standards affecting its operations.

Further, had respondent apprised itself of the standards affecting its operations it further had the option of applying for a variance from the Department of Labor if it encountered any problems in bringing its equipment into compliance.

The Review Commission, in treating of machine guarding against the hazards of nip points, rotating parts, etc., stating in the

case of Secretary v. Irvington Moore, Div. of U. S. Natural Resources, Inc., 16 OSHRC 608 (RC 1975) (majority opinion), involving a Cincinnati press brake:

> "Since press brakes are specifically excluded from the requirements of section 217, they must either be covered by the terms of section 212 or not at all by the Secretary's standards."

held that section 212 applied to all machines, and in particular section 212(a)(3)(iv), which provides for the point of operation guarding of "(d) Power presses".

See also Secretary v. Gem-Top Mfg., Inc., 16 OSHRC 591 (RC 1975) (majority opinion), and Secretary v. Diebold, 76 OSAHRC 3/E5 (RC 1976) (majority opinion).

In the Diebold case, supra., the defense was asserted that ANSI standard B11.1 excluded press brakes from the standard. This is similar to the argument made herein with regard to respondent's Cleveland mechanical power presses 1, 2 and 3. This argument was rejected.

Also, in Diebold, supra., the argument was made that the standard was impermissibly vague, in that it failed to state with particularity how guarding of press brakes is to be accomplished. This argument was also rejected with the majority of the Commissioners holding that the standard was a "performance standard" stating the results required, rather than specifying the specific type of guard to be used.

The question of impossibility of compliance was also offered

as an argument, and the majority of the Commissioners in rejecting this argument stated:

> "Because the point of operation of any machine must be sufficiently accessible to permit insertion of the material being processed, for some types of machines and some operations it will not be possible to utilize a guarding device 'so designed and constructed as to prevent the operator from having any part of his body in the danger zone during the operating cycle' as required by §1910.212 (a)(3)(ii). In some cases involving press brakes, we have stated that compliance can be achieved by means such as hand tools and work rests which keep the hands of employees at a safe distance from the point of operation."

See also Secretary v. Garrison & Assoc., Inc., 17 OSAHRC 188 (RC 1975), and Secretary v. Sheet Metal Specialty Co., 17 OSAHRC 212 (RC 1975).

In Secretary v. Buckeye Industries, Inc., 75 OSAHRC 21/B3 (RC 1975), the majority opinion dealt with an interpretation of 29 CFR 1910.212(a)(3)(ii) where a citation had been vacated on the ground that the Secretary had failed to prove that it was "mechanically possible" for guards to be placed upon the machines, and that if guards were installed they would not themselves create hazards to the employee.

The majority held:

> "That compliance with a standard is impossible is, at most, an affirmative defense to a finding of non-compliance with a standard. (Brennan v. OSHRC & Underhill Constr. Corp., 513 F.2d 1032, 1036 (2d Cir. 1975)) and particularly 29 CFR §1910.212(a)(3)(ii) (see Garrison & Associates, Inc., No. 4235 (April 22, 1975) (lead and concurring opinions)). Placing the burden of proof of this defense upon the Secretary was error."

With respect to respondent's argument that the Secretary must show how respondent's machines must be guarded, the majority went on to say:

> "We do not consider it incumbent upon the Secretary to demonstrate what the employer should have done to comply with section 1910.212(a)(3)(ii). The standard itself prescribes the performance required by guarding. It also suggests several guarding methods such as barrier guards, two hand-tripping devices and electronic safety devices. See 29 CFR §1910.212(a)(1). An employer's own abilities and that of industry may be relied upon to devise suitable ways to conform to the requirements of a standard. Society of the Plastics Industry, Inc. v. O.S.H.A., 509 F.2d 1301, 1309 (2d Cir. 1975, cert. denied 95 S. Ct. 1998 (1975))."

For purposes of finding a serious violation, it need only be shown by the evidence or the record that there is substantial probability that death or serious physical harm could result from the operations of respondent.

The presence of past injuries is unnecessary for finding of non-compliance (Lee Way Motor Freight, Inc. v. Secretary of Labor, 7 OSAHRC 1128 (RC 1974), aff'd 511 F.2d 864 (10th Cir., 1975)).

Consideration of serious citation 2, item 1(b)(3)(d), from the facts stipulated by the parties, it is apparent and agreed to by complainant that regular safety inspections are conducted of the entire premises of the respondent and all machines contained therein, with written reports of said inspections deemed prepared and filed by the inspector, one James L. Nickel, Senior Engineer for American Mutual Liability Co.

There are regular safety meetings of key employees and management,

wherein safety measures and requirements are discussed of which written reports are also prepared and filed.

It is also standard operating procedure for all employees of respondent to conduct a visual inspection of machinery prior to its use and to perform minor maintenance thereon, and to report any maintenance required which cannot be immediately performed by the operator to the plant manager or superior for his action.

We turn to the criteria to be considered with respect to appropriate assessment of civil penalty: Due consideration being given to the size of business of the respondent, which is found to be small; the gravity of the violation, which in this case would involve either amputation or mutilation, so therefore must be considered moderate to severe; the fact that respondent has never been cited for a safety violation prior to the inspection in question; and, in particular respondent's exemplary history, namely, that respondent has had no history of any injuries from any of the cited equipment during its normal operation over a period of the past 15 years.

Respondent, from record evidence, made a good faith effort to protect its employees albeit not in accordance with the standard, in that it had posted warning signs as to the dangers of the machine in the proper operation thereof; maintained an active and ongoing training program whereby employees and operators of the machines were informed of their operating processes and the dangers involved therein; and, color coding of the machine's moving parts

and positive guards on other portions of the machine other than the point of operation. While all of this was not comporting to the standard, it evidences a concern by respondent for employee safety.

Also taking into account other Commission precedential cases on point of operation guarding, i.e., Secretary v. Central Steel & Tank Co., 75 OSAHRC 9/A2 (RC 1975); Secretary v. Buckeye Industries, supra.; Secretary v. Diebold, supra.; and, Secretary v. Paccar, Inc., 17 OSAHRC 595 (RC 1975), it is felt that a penalty of $200.00 is appropriate.

## FINDINGS OF FACT

Based upon the preponderance of the credible evidence of record, the following findings of fact are made:

1. Respondent's accurate legal corporate name is Geo. C. Christopher & Son, Inc., incorporated in the State of Kansas with its principal office at 1220 Blaine, Wichita, Kansas 67201.

2. The respondent operates steel fabricating facilities in the State of Kansas, and regularly conducts business transactions in numerous states and its business activities are such that they affect commerce at the time of the alleged violation.

3. At the time of the inspection, the respondent was the owner of and had control of any equipment or machinery, the use of which is referred to in the citation.

4. During the year 1975 respondent shipped approximately 9,299

tons of structural steel.

5. Respondent presently employs approximately 250 production and management employees.

6. The original citation and all amended citations were posted on the company bulletin boards located in each shop on the date of their receipt by respondent.

7. The citation and notice of proposed penalty was properly served upon respondent.

8. Stephen R. Frye was the safety inspector for OSHA on the inspection date and he had the training and experience as set forth in complainant's pre-trial submissions.

9. With respect to citation 2, item 1, 29 CFR 1910.212(a)(1), during the period of December 3-9, 1975, one or more methods of machine guarding was not provided to protect the operator and other employees from hazards such as those created by point of operation, ingoing nip points and rotating parts on three Cincinnati and one Steelweld shears.

10. Operators' fingers, hands and/or arms were exposed to injury by the ingoing rolls on one 5-foot plate roll machine and a Kling foot roll.

11. No guards or devices were provided to prevent employees from injury created by downward movement of back guages located on two Cincinnati shears.

12. With respect to citation 2, item 1, 29 CFR 1910.212(a)(3)(ii), during the period of December 3-9, 1975, the point of operation

was not guarded where the operation exposed an operator and/or employee to injury during the operating cycle wherein the operator's fingers or hands were exposed to injury created by the blade on three Cincinnati shears and one Steelweld shear.

13. The opening between the bed and blade and/or punch exposed the operator's fingers to injury on an Eclipse Combination punch and shear, the rear side of a Kling angle shear, an alligator shear, the front and rear sides of a Long and All Statter shear, an Eclipse small combination punch and shear, and the punch station on an Eclipse small combination punch and shear.

14. Respondent's two Cleveland mechanical power presses 1 and 2 exposed the operator's fingers to injury, in that no point of operation guard or properly applied and adjusted point of operation devices were provided on Cleveland 1 and 2 power presses; the pedal mechanisms were not protected to prevent unintended operation from falling or moving objects or accidental stepping onto Cleveland power presses 1, 2 and 3; non-slip pads were not firmly attached to the pedals on Cleveland power presses 1, 2 and 3.

15. Respondent had a program of periodic and regular inspection of power presses, which was established and followed with written reports being prepared and filed, along with regular safety meetings of key employees in management with a system of reporting any maintenance requirements immediately to the plant manager or superior for action.

## CONCLUSIONS OF LAW

1. Respondent was in serious violation of 29 CFR 1910.212(a)(1), item 1, subitem (a)(I)(a)(b)(c)(d); subitem (a)(2)(a)(b); and, subitem (a)(3)(a)(b).

2. Respondent was in serious violation of 29 CFR 1910.212(a)(3)(ii), item 1, subitem (b)(1)(a)(b)(c)(d); subitem (b)(2)(a)(b)(c)(d)(e)(f), and, subitem (b)(3)(a)(b)(c).

3. Respondent was not in violation of 29 CFR 1910.212(a)(3)(ii), item 1, subitem (b)(3)(d).

## DECISION AND ORDER

Based upon the foregoing findings of fact and conclusions of law, it is hereby ordered that:

1. Citation 2 for serious violation of 29 CFR 1910.212(a)(1), subitems (a) through and including (a)(3)(b) are affirmed.

2. Citation 2 for serious violation of 29 CFR 1910.212(a)(3)(ii), item 1, subitem (b)(1)(a)(b)(c)(d), subitem (b)(2)(a)(b)(c)(d)(e)(f), and subitem (b)(3)(a)(b)(c), are affirmed.

3. Citation for serious violation of 29 CFR 1910.212(a)(3)(ii), item 1, subitem (b)(3)(d), is vacated.

4. A penalty of $200.00 is assessed.

| v. | : | OSHRC Docket No. 76-2894 |
| JOHN T. BRADY & CO., INC., | : | |
| Respondent. | : | |
| | : | |

DECISION

Before ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

A decision of Administrative Law Judge Seymour Fier is before us for review pursuant to section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). Judge Fier ruled that the John T. Brady & Co., Inc., committed a violation of the general duty clause, section 5(a)(1) of the Act.[1/] We reverse the judge and vacate the citation on the ground that specific standards render citation to the general duty clause inappropriate.

---

1/ Section 5(a)(1) of the Act, 29 U.S.C. § 654(a)(1), provides that "[e]ach employer . . . shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees."

Commissioner Cleary directed review of the judge's disposition of the § 5(a)(1) charge. John T. Brady was also found in violation of the construction safety standards at 29 C.F.R. §§ 1926.150(e)(1), 1926.150(e)(3), and 1926.500(d)(2). These items are before the Commission pursuant to a direction for review "for error" by former Commissioner Moran. Because neither party has taken exception to the judge's disposition of these items, and in the absence of a compelling public interest, the Commission will not review them. Water Works Installation Corp., 76 OSAHRC 61/B8, 4 BNA OSHC 1339, 1976-77 CCH OSHD ¶ 20,780 (No. 4136, 1976); Abbott-Sommer, Inc., 76 OSAHRC 21/A2, 3 BNA OSHC 2032, 1976-76 CCH OSHD ¶ 20,428 (No. 9507, 1976).

The citation at issue alleged that John T. Brady violated the general duty clause by failing to provide overhead protection at entrances to a building that was under construction. The citation identified two conditions, or practices, at the construction site which allegedly posed a danger of physical injury: objects could fall onto employees from overhead loads being transported by a crawler crane, and objects could fall onto employees from the open-sided upper levels of the building. The Secretary contended that the entrances to the building should have been equipped with canopies.

The issues directed for review centered on whether the Secretary carried his burden in proving such elements of a general duty clause violation as employee exposure to the hazard and recognition of the hazard. However, after this case had been directed for review and the parties had submitted their review briefs, we issued our decision in A. Prokosch & Sons Sheet Metal, Inc., 81 OSAHRC 96/A2, 8 BNA OSHC 2077, 1981 CCH OSHD ¶ 24,840 (No. 76-406, 1980)("Prokosch"). We held there that the general duty clause does not apply to the hazard of objects falling from a crane at a construction site. Although ordinarily we will not decide issues not directed for review,[2/] in order that our decision in this case be consistent with Prokosch, we will decide the case on grounds other than those touched upon in the direction for review.

It is well established that the applicability of a standard renders citation to the general duty clause inappropriate. Mississippi Power & Light Co., 79 OSAHRC 109/D12, 7 BNA OSHC 2036, 1980 CCH OSHD ¶ 24,146 (No. 76-2044, 1979). Citation to the general duty clause in the instant case is rendered inappropriate both as to the hazard of objects falling

---

2/ Commission Rule 92(d), 29 C.F.R. § 2200.92(d).

from a crane and the hazard of objects falling from upper levels of a building. ANSI B30.5-1968, section 5-3.2.3(f), which provides that "[t]he operator should avoid carrying loads over people,"[3/] renders the general duty clause inapplicable to the hazard of objects falling from a crawler crane. The hardhat standard at 29 C.F.R. § 1926.100(a)[4/] and the perimeter guarding standards at 29 C.F.R. §§ 1926.500(d)(1)[5/] and 500(f)(3)(ii)[6/] render the general duty clause inapplicable to the hazard of objects falling from upper levels of the building. See Prokosch, supra.

---

3/ ANSI B30.5-1968, Safety Code for Crawler, Locomotive and Truck Cranes, is incorporated by reference into the construction industry standards at 29 C.F.R. § 1926.550(b)(2).

4/ 29 C.F.R. § 1926.100(a) provides in pertinent part:

> Employees working in areas where there is a possible danger of head injury from impact, or from falling or flying objects . . . shall be protected by protective helmets.

5/ 29 C.F.R. § 1926.500(d)(1) provides as follows:

> (d) Guarding of open-sided floors, platforms, and runways. (1) Every open-sided floor or platform 6 feet or more above adjacent floor or ground level shall be guarded by a standard railing, or the equivalent . . . on all open sides, except where there is entrance to a ramp, stairway, or fixed ladder. The railing shall be provided with a standard toeboard wherever, beneath the open sides, persons can pass, or there is moving machinery, or there is equipment with which falling materials could create a hazard.

6/ 29 C.F.R. § 1926.500(f)(3)(ii) provides as follows:

> Where material is piled to such height that a standard toeboard does not provide protection, paneling or screening from floor to intermediate rail or to top rail shall be provided.

"Toeboard" is defined at 29 C.F.R. § 1926.502(m):

> A vertical barrier at floor level erected along exposed edges of a floor opening, wall opening, platform, runway, or ramp to prevent falls of materials.

Although we conclude that specific standards rather than the general duty clause apply to the cited hazard and workplace conditions and practices,[7/] we will not amend the citation and complaint to allege violations of those standards. ANSI B30.5-1968, section 5-3.2.3(f) is an advisory standard and therefore cannot serve as a basis for finding a violation of the Act. Prokosch, supra, 8 BNA OSHC at 2080-81, 1980 CCH OSHD at p. 30,630. The standards at 29 C.F.R. §§ 1926.100(a), 1926.500(d)(1) and 1926.500(f)(3)(ii) are mandatory, not advisory, but amendment at this juncture would be inappropriate inasmuch as citations resting on these standards would raise questions of law and fact which the parties have not had an opportunity to address. Mississippi Power & Light Co., supra.

Accordingly, the section 5(a)(1) citation is vacated. In all other respects, the judge's decision is affirmed. SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

RAY H. DARLING, JR.
EXECUTIVE SECRETARY

DATED: FEB 26 1982

---

7/ Chairman Rowland does not agree with his dissenting colleague's suggestion that the standards on which the majority relies do not render the 5(a)(1) citation inappropriate because they would not provide employees with complete protection against the hazards of falling objects. He notes that it is not the Commission's function to question the wisdom or adequacy of the Secretary's standards. See The Budd Co., 74 OSAHRC 12/A2, 1 BNA OSHC 1548, 1973-74 CCH OSHD ¶ 17,387 (No. 199, 1974), aff'd, 513 F. 2d 201 (3d Cir. 1975). The applicability of a specific standard or standards to the cited conditions renders § 5(a)(1) inapplicable regardless of whether more protection against the cited hazard would be desirable.

Chairman Rowland further disagrees with his colleague's suggestion that the majority errs in holding that the floor guarding standards at § 1926.500 are applicable because different standards apply during steel erection in tiered buildings. He notes that, even if the steel erection perimeter guarding standard applies in this case, the critical point is that there is an applicable standard. Whether that standard is sufficiently stringent is not an appropriate inquiry.

BRADY

COTTINE, Commissioner, dissenting:

In A. Prokosch & Sons Sheet Metal, Inc., 81 OSAHRC 96/A2, 8 BNA OSHC 2077, 1980 CCH OSHD ¶24,840 (No. 76-406, 1980), appeal dismissed, No. 80-4241 (2d Cir. March 27, 1981), I stated in dissent that my colleagues had once again created a void in the protection afforded American workers. Today that void expands again. See also Cornell & Co., Inc., OSHRC Docket No. 78-5956 (Feb. 26, 1982)(lead & dissenting opinions).

I

Testimonial evidence establishes that employees at the construction site using the unprotected or inadequately protected entrances were exposed to the hazard of being struck by any one, or any combination of, the following: sparks, slag, bolts, wire, hand tools, concrete chips, lumber, nails, steel decking, reinforcing rods, and other miscellaneous debris. The sources of these overhead hazards from work being performed above and adjacent to the entrances included the following: hauling of steel by crane, overhead welding, concrete pouring and concrete stripping, forming out of columns, placement of reinforcing rods, and spot welding of steel decking. According to both the compliance officer and the Respondent's field superintendent, the purpose of an overhead canopy at entrances is to protect employees from materials accidentally dropped or kicked over the edge of the building. Furthermore, the compliance officer testified that wind conditions at this site created an additional problem because materials on the roof or open-sided floors could be blown off. These included untacked sections of steel decking.

II

The Commission majority concludes that citation under section 5(a)(1) of the Act, the general duty clause, is inappropriate because specific safety standards are applicable. The standards they cite are:

(1) ANSI B30.5-1968, section 5-3.2.3(f), an ANSI standard that deals with the carrying of crane loads over people and assertedly incorporated by reference at 29 C.F.R. §1926.550(b)(2); (2) 29 C.F.R. §1926.100(a), the construction hardhat standard; and, (3) 29 C.F.R. §§1926.500(d)(1) and 500(f)(3)(ii), construction standards covering the guarding of open-sided floors, platforms, and runways. For the reasons that follow their conclusion is in error.

A.

Commission precedent clearly establishes that "a citation for a violation of section 5(a)(1) is invalid and will not lie where a duly promulgated occupational safety and health standard is applicable to the condition or practice that is alleged to constitute a violation of the Act." Brisk Waterproofing Co., Inc., 73 OSAHRC 30/E1, 1 BNA OSHC 1263, 1264, 1973-74 CCH OSHD ¶16,345 at p. 21,261 (No. 1046, 1973) (emphasis added). See A. Prokosch & Sons Sheet Metal, Inc., supra (dissenting opinion) and cases cited.

Section 5-3.2.3(f) of ANSI B30.5-1968, Safety Code for Crawler, Locomotive, and Truck Cranes, states that "[t]he operator should avoid carrying loads over people." This provision is advisory, not mandatory. A. Prokosch & Sons Sheet Metal, Inc., supra (lead & dissenting opinions). Consequently, it is not a standard nor was it duly promulgated. A. Prokosch & Sons (dissenting opinion). As I noted in Prokosch, section 5(a)(1) is intended "to cover those situations which might not be treated by a standard promulgated by the . . .[Secretary]." Sun Shipbuilding & Drydock Co., 73 OSAHRC 44/A9, 1 BNA OSHC 1381, 1973-74 CCH OSHD ¶16,725 (No. 161, 1973). The hazard of overhead falling objects from the crane operating above the cited entrances is not regulated by a promulgated occupational

safety and health standard. Accordingly, for the reasons more fully set forth in my separate opinion in Prokosch, the ANSI provision discovered by my colleagues does not preclude application of section 5(a)(1) to these facts.

B.

The record evidence regarding the usefulness of hard hats in protecting against falling objects at this site consists of the following testimony of the compliance officer:

> Q. Would the fact that the employer's man may be wearing a hard hat prevent the kind of injury that you are talking about from occurring?
>
> A. If a man is lucky enough to be hit on the head and he has a hard hat on, he might not have a serious injury there, but other parts of his body are exposed, which is the reason for a canopy. A canopy is the general protection in an entrance area. A man, if he walked under an unprotected area, then his shoulder or maybe worse, his extremities are exposed even if he is wearing a hard hat. If he is struck by a bolt falling three, four stories and he gets hit on the shoulder it could cause serious harm.

Hearing transcript at 42.

Section 1926.100(a) requires that employees working in areas where there is a danger of head injury from falling objects be protected by protective helmets. However, the only relevant evidence indicates that although a hard hat may protect against serious head injury, it provides no protection against other bodily injury.[1/] Simply stated, it is not a substitute for other protection against falling materials.

C.

At the time of inspection the structure was in various stages of construction with areas above and adjacent to the cited entrances

---

1/ It must also be noted that the Commission has previously acknowledged that a hard hat would not abate the hazard of a heavy overhead load falling onto a worker. General Electric Co., 80 OSAHRC 9/B9, 7 BNA OSHC 2183, 2186 n. 10, 1980 CCH OSHD ¶24,268 at p. 29,552 n. 10 (No. 15037, 1980).

either completed with roof areas, or in the steel erection stage, including erection of structural steel members and placement and welding of steel decking. The compliance officer noted that the floors of the structure were open-sided, did not have toeboards, but did have perimeter protection in the form of a wire cable.

The final standards my colleagues have uncovered that assertedly apply to the cited conditions are the construction perimeter guarding standards published at 29 C.F.R. §§1926.500(d)(1) and 500(f)(3)(ii), dealing with guarding of open-sided floors, platforms, and runways. Their conclusion is in error for several reasons.

First, during steel erection in tiered buildings the perimeter guarding standards at section 1926.500, requiring standard railings and toeboards, do not apply. Rather, the requirement in section 1926.750(b)(1)(iii) that the periphery be guarded by a "safety railing of 1/2-inch wire rope or equal" applies.[2/] Wire cables were in place where required. Second, certain sections of the structure had completed roof areas. Under Commission and courts of appeals precedent, a roof is not a floor within the meaning of section 1926.500(d)(1) and the standard would not apply to these areas.[3/] See Dun-Par Engineered Form Co., 80 OSAHRC 14/E6, 8 BNA OSHC 1044, 1980 CCH OSHD ¶24,238 (No. 16062, 1980), appeal filed, No. 80-1401 (10th Cir. Apr. 17, 1980); Central City Roofing Co., Inc., 76 OSAHRC 61/A2, 4 BNA OSHC 1286, 1976-77 CCH OSHD ¶20,761 (No. 8173, 1976). Finally, perimeter protection in the form of a wire cable or standard railing and a toeboard would not prevent materials from being

---

2/ The Respondent was not cited for noncompliance with perimeter protection requirements. The Respondent was cited for a violation of section 1926.500(d)(2) for failing to erect guardrails on a 30-foot-long, 2 - 3 foot wide runway leading to its office trailer. This item was affirmed by the judge. The Respondent did not petition for review of this item.

3/ Although there is no direct testimony that work was being performed on the roof, the compliance officer specifically stated that materials on a roof area could be blown off because of wind conditions.

dropped over the perimeter by employees working near the edge, would not stop sparks and slag created by the welding of metal decking to the structural steel from falling over the edge, and would not be an effective barrier to material being carried by the wind, particularly sheets of decking.

III

For the reasons set forth above, citation to section 5(a)(1) of the Act is appropriate and the merits of the charge should be decided by the Commission. Accordingly, I dissent.

## DECISION AND ORDER

Fier, Judge:

## PRELIMINARY STATEMENT

This is a proceeding pursuant to section 659 of the Occupational Safety and Health Act of 1970 (29 U.S.C. 651 *et seq.*, hereinafter called the Act), wherein respondent contests the citations and penalties for one serious and three nonserious alleged violations. The citations dated

June 24, 1976, were based on an inspection conducted April 13, 14, 15, 19, 20, 21 of 1976. The citations and proposed penalties were issued pursuant to sections 9(a) and 10(a) of the Act.

Pursuant to section 10(c) of the Act, 29 U.S.C. 659(c), respondent through its attorney by letter dated June 30, 1976, noted its timely contest to the citations and proposed penalties. The citations for the alleged violations sets forth the following:

Citation No. 1 (Nonserious)

| Item | Standard | Description of Alleged Violation |
|---|---|---|
| 1 | 29 CFR 1926.150 (e)(1) | 29 CFR 1926.150(e)(1) in that an alarm system was not established by the employer whereby employees on the site and the local fire department can be be alerted in case of fire or other emergency at the jobsite. |

A penalty of $50.00 was proposed.

| | | |
|---|---|---|
| 2 | 29 CFR 1926.150 (e)(2) | The alarm code and reporting instructions were not conspicuously posted at phones and at employee entrances to the jobsite. |

No penalty was proposed.

| | | |
|---|---|---|
| 3 | 29 CFR 1926.500 (d)(2) | Failure to provide a standard railing or equivalent protection of the main passageway that led to the outdoor office trailer that was located on or above grade elevation by section B/C. The passageway was approximately 30 feet long and a drop of 8 to 9 feet could result. Such passageways shall be guarded by a standard railing or equivalent on all open sides 4 feet or more above floor or ground level. |

A penalty of $55.00 was proposed.

Citation No. 2 (Serious)

| Item | Standard | Description of Alleged Violation |
|---|---|---|
| 1 | Public Law 91-596 General Duty Clause Section 5(a)(1) | Exposure of employees to the dangers of falling material where inadequate or no overhead protection was provided over two designated entrances to section B/C and section E. This is a recognized hazard in the construction industry. Employees were exposed through their normal duties in the course of their work in and about the structure. Overhead hazards were high in that materials were being transported from grade to upper levels by means of tower cranes located in the immediate areas of these main entrances. Should any materials fall from these overhead floor levels, a resulting accident could be death or serious physical harm to employees. |

A penalty of $500.00 was proposed.

STANDARD AS PROMULGATED

29 CFR 1926.150(e) Fire alarm devices.

(1) An alarm system, e.g., telephone system, siren, etc., shall be established by the employer whereby employees on the site and the local fire department can be alerted for an emergency.

(2) The alarm code and reporting instructions shall be conspicuously posted at phones and at employee entrances.

29 CFR 1926.500(d)

(2) Runways shall be guarded by a standard railing, or the equivalent, as specified in paragraph (f) of this section, on all open sides, 4 feet or more above floor or ground level. Wherever tools, machine parts, or materials are likely to be used on the runway, a toeboard shall also be provided on each exposed side.

29 U.S.C. 654(a)(1) which provides as follows:

> Sec. 5(a) Each employer--(1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or likely to cause death or serious physical harm to his employees.

## ISSUES

1. Whether the respondent violated the Occupational Safety and Health Act as alleged.

2. Whether the respondent failed to comply with sections 29 CFR 1926.150(e)(1); 29 CFR 1926.150(e)(2); 29 CFR 1926.500 (d)(2); if so did it violate section 29 U.S.C. 654(a)(2) of the Act.

3. Whether the respondent violated 29 U.S.C. 654(a)(1).

4. If the respondent is found to have violated any or all of the above; what penalty if any should be assessed.

## EVIDENCE

The respondent is a corporation organized under the laws of the State of New York. Many of the materials and supplies used are manufactured in other states.

John Tomich a compliance officer with the Occupational Safety and Health Administration of the U.S. Department of Labor, (hereafter referred to as C.O.) visited the respondent's worksite on April 13, 14, 15, 19, 20 and 21 of 1976 (Tr. 12)*.

---

* Denotes transcript page.

The worksite consisted of additional structures to be added to the Veteran's Hospital, located on Kingsbridge Road in the Bronx, New York (Tr. 10). The C.O. met with the respondent's representative Joseph Meli, field superintendent (Tr. 12, 79).

In the course of the inspection, the C.O. observed that there was no fire protection or alarm system in violation of 29 CFR 1926.150(e)(1) (Tr. 47). In addition the C.O. noted that there was also an absence of an alarm code and reporting instructions. These were required to be posted at the phone locations and employee entrances (Tr. 52). The respondent was thereupon cited for an alleged violation of 29 CFR 1926.150 (e)(2).

The C.O. next observed that at the main passageway leading to the respondent's outdoor office trailer, there was no standard railing or equivalent protection. The walkway was approximately 2 to 3 feet wide and 30 feet long. A fall of 8 or 9 feet could result from the walkway to the ground below (Tr. 45-46). The respondent's employees have access and use the walkway to get to the trailer (Tr. 47). The C.O. did not see any of respondent's employees using the walkway (Tr. 72). The respondent was subsequently cited for an alleged violation of 29 CFR 1926.500(d)(2) (Tr. 45-46). The Secretary made a

motion to amend the citations and reduce all of the above "nonserious" violations to "zero" penalty (Tr. 5). The decision on Secretary's motion was reserved pending receipt of all of the evidence.

The C.O. during his inspection noted that there was no overhead protection at the designated entrances. The exposure of respondent's employees to this danger constituted a serious violation that could result in death or serious injury. There was also a large crane hauling steel travelling parallel to the B&C area where one of the designated entrances was located (Tr. 24). The C.O. testified that he observed an amployee of the respondent using the unprotected area (Tr. 39,71). This was denied by the respondent (Tr. 90). The C.O. indicated that the failure to have a protective canopy constituted a violation of 29 CFR 654(a)(1). The testimony showed that construction work was going on at the time in the area of the "purported" designated entrance (Tr. 24, 26). In addition, there were toilets located in front of the area at "B-C" and also the employer trailers (Tr. 27, 23). The hazard is said to be recognized as such throughout the construction industry. In furtherance of this contention the Secretary introduced a copy of a New York State statute (Complainant's Exh. C-2). The Secretary asserts that the above statute has been in effect for over 80 years (Tr. 29).

OPINION

The issue of jurisdiction can be quickly disposed of by noting the pleadings where the respondent readily concedes that it is engaged in general contracting. Also the concession that it uses materials and supplies which cross state lines. As such there is enough evidence to find that the respondent is subject to the provisions of the Act.

The citation for the nonserious violations are not factually in dispute. The evidence shows that the fire alarm system and requirement for the posting of instructions was not in existence at the worksite. The respondent asserts that one of the employers did have a whistle on the site and another employer had a horn (Tr. 48). It was also asserted that some of the employers did have telephones in their trailers located in front or near the worksites. However, none were located "inside" of the worksite (Tr. 48). Further, the use of these devices were for the purpose of signalling "into" the site and not for the purpose of signalling "out". Thus an employee working in a structure who needed help to report a fire or other hazard, would not have any signal device to summon aid in an emergency. It is reasonable to assume that if an employee's clothes caught fire, time would be important, and the close proximity of an alarm system can easily make the difference regarding the outcome of the emergency. The

respondent asserts that the responsibility of installing the alarm system and instruction code should rest on the prime contractor. The respondent did not seek or file for a variance of the standard. There is also no evidence to show that an effort was made to seek compliance by the prime contractor. Accordingly, the Secretary has carried its burden of proof. The respondent is found to have violated the standards 29 CFR 1926.150(e)(1) and (e)(2). As to the penalty in the above violations, the low gravity of the violations in this particular instance justifies a reduction in the penalty. Therefore, the Secretary's motion to reduce the above two violations to zero will be adopted.

The remaining "nonserious" alleged violation of 29 CFR 1926.500(d)(2) is concerned with the absence of guardrails on the walkway to the respondent's trailer. The hazard of a fall of 8 to 9 feet is not denied (Tr. 45-46). A fall of such a distance could easily result in a serious injury. The C.O. testified that he did not see any guardrails on the walkway. The testimony shows that the walkway did lead to the respondent's trailer where equipment was stored and it was used as an office (Tr. 46). The C.O. did not see any of respondent's employees on the walkway at the time of inspection. However, the employees did report to the trailer office when coming to work (Tr. 47). Accordingly, access has been established. The Secretary has

carried its burden of proof. The Secretary has moved that the proposed penalty be reduced to zero. In view of the fact that no employees were observed using the walkway, the Secretary's motion will be adopted and the penalty reduced to zero.

The final question to be determined herein, is whether in the language of section 5(a)(1) of the Act, respondent met the requirement that he furnish to each of his employees employment and a place of employment which was free from "recognized hazards" that are causing or are liable to cause death or serious physical harm to his employees. As previously indicated, complainant has charged respondent with violating section 5(a)(1) of the Act, generally referred to as the "general duty clause", in that the employer did not cause to be constructed, a canopy over the entrance of the worksite, so as to provide safe egress and ingress. The testimony shows that one of the respondent's employees was observed using the designated entrance with no overhead canopy (Tr. 39, 71). While the respondent denies using the entrance, a review of the evidence and testimony gives ample support to the observation of the C.O. (Exhs. C-1, Resp-A). The stage of construction and testimony relative thereto support the Secretary in its contention that an employee of respondent was observed using the designated entrance without a protective canopy. The C.O.

produced a copy of a New York Industrial Code Rule (Exh. C-2), Part 23 of Title 12 of the Official Compilation of Codes, Rules and Regulations of the State of New York.

> 23-17 Protection from general hazards. (a) Overhead hazards. (1) Every place where persons are required to work or pass that is normally exposed to falling material or objects shall be provided with suitable overhead protection. Such overhead protection shall consist of tightly laid sound planks at least two inches thick full size, tightly laid three-quarter inch exterior grade plywood or other material of equivalent strength. Such overhead protection shall be provided with a supporting structure capable of supporting a loading of 100 pounds per square foot."

This provision although no longer a State statute, would tend to support the C.O.'s position that the use of an overhead canopy is an accepted industry practice, recognized in the construction industry to protect its workers against overhead hazards. Secretary v. Puget Sound Power and Light Co., Docket No. 15, 1 OSAHRC 844 (September 28, 1972); Brennan v. Occupational Safety and Health Review Commission, 494 F.2d 460 (8th CA 1974). A statute even though it has been repealed for various reasons, may still be received as part of the total evidence to identify an industry-wide practice and existing hazard. The hazard was apparent. The likelihood of a serious or fatal injury from a falling object could easily cause a fatal injury. While the respondent asserts that it did not use the entrance the weight of evidence shows otherwise.

Secretary v. Stephenson Enterprises, Inc., Docket No. 5873 (R.C., September 22, 1976). One purpose of the Act is to prevent the first accident. Lee Way Motor Freight, Inc. v. Secretary (1 OSHC 1689); 511 F.2d 864 (10th C.A.-February 19, 1975).

The Secretary has established the presence of a "recognized" hazardous condition. The question of actual knowledge is established from the respondent's statement that he has been in the construction industry about thirty-five years (Tr. 80). The evidence has gone further than required. The Court has previously determined; once the Secretary proves that a condition is "recognized" as a hazard in the industry, he need not prove that the employer had actual knowledge of the hazard. National Realty and Construction Co., v. Occupational Safety and Health Review Commission, Docket No. 85; 489 F.2d 1257, 1265 n 32 (D.C. Cir. 1973). See also Secretary v. Mid-Hudson Automatic Sprinkler Co., Inc., Docket No. 76-0575 (October 12, 1976). The Secretary has established; (1) that the employer failed to render its workplace "free" of a hazard which was (2) "recognized" and (3) "causing" or likely to cause death or serious physical "harm"; supra

The Secretary has carried its burden of proof. The respondent in mitigation, had only eight employees on the

worksite. In addition, the abatement of the violation was undertaken without delay. Under the circumstances, a penalty of $200.00 would not be inappropriate.

The respondent's brief has been carefully considered.

All motions not previously disposed of are denied.

## FINDINGS OF FACT

The credible evidence and the record as a whole establishes preponderant proof of the following facts:

1. Respondent, John T. Brady & Co., Inc., is engaged in the construction business. The materials used and effects on commerce establishes that it is engaged in interstate commerce.

2. Respondent did not have an alarm system for fire and other emergencies at the worksite.

3. Respondent did not have reporting instructions and an alarm code reduced to writing, posted at employee entrances and conspicuously posted at phones as required.

4. Respondent did not have a standard railing on its runway as required.

5. The danger of falling objects at or near the entrance to the subject worksite was a recognized hazard likely to cause death or other serious injuries to respondent's employees.

6. The absence of a protective canopy at the entrance to the worksite to shield respondent's employees from the inherent dangers within, were within the scope of respondent's knowledge.

7. The use of a construction shield canopy and the hazards it seeks to prevent are common knowledge to the industry and to employers such as respondent.

8. The evidence is sufficient to show respondent's failure to safeguard its employees by failing to provide a construction shield canopy.

9. Respondent made no effort to prevent its employees from entering the area of the hazard.

## CONCLUSIONS OF LAW

1. The respondent is and was at all times herein, in a business affecting commerce within the meaning of section 3(5) of the Occupational Safety and Health Act of 1970.

2. The Occupational Safety and Health Review Commission has jurisdiction over the subject matter and parties to this action.

3. Respondent violated 29 U.S.C. 654(a)(2) by failing to comply with 29 CFR 1926.150(e)(1); (e)(2); and 29 CFR 1926.500(d)(2).

4. Respondent violated 29 U.S.C. 654(a)(1) by failing to furnish its employees employment in a place free from recognized hazards in a place likely to cause death or serious physical harm to them.

O R D E R

Upon the basis of the foregoing findings of fact and conclusions of law, and upon the entire record, it is hereby ORDERED that:

Citation number one, items one, two and three, are affirmed. No penalty is assessed for the items of citation one.

Citation number two is affirmed. A penalty of $200.00 is assessed.

DECISION

Before ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

The issue in this case is whether Delta Field Erection, Inc. ("Delta Field") committed a serious violation of the electrical standard for construction work at 29 C.F.R. § 1926.401(j)(4).[1/] This section prohibits the operation of portable electric lighting at more than 12 volts in moist and/or other hazardous locations. We conclude that the Secretary of Labor ("the Secretary") failed to establish that Delta Field had knowledge of the violative condition and reverse the administrative law judge's finding of a violation.

---

1/ 29 C.F.R. § 1926.401(j)(4) provides:

§ 1926.401 Grounding and bonding.

* * *

(j) Temporary lighting.

* * *

(4) Portable electric lighting used in moist and/or other hazardous locations, as for example, drums, tanks, and vessels shall be operated at a maximum of 12 volts.

Delta Field is a general construction firm which had subcontracted with the Tennessee Oil Company ("Tenneco") to replace damaged parts in an ethyl benzene storage tower in Chalmette, Tennessee. Delta Field's assignment was to bolt back into place metal trays which had been removed from the tower for repair. Delta Field's employees used ratchets and wrenches to bolt the trays onto metal racks.

In preparation for this work, Tenneco had purged the tower of ethyl benzene and closed off all natural gas pipelines leading into the structure. It had also, prior to Delta Field's arrival at the tower, installed a system of portable electric lights. This system included an undetermined number of 32-volt lights and one 110-volt drop cord, all connected by extension cords to portable transformers outside the tower. All but two of the light fixtures were the explosion-proof type.

While Delta Field's employees were engaged in replacing the metal trays, a Tenneco employee opened one of the natural gas lines leading into the structure under the mistaken impression that he was opening a fresh air line. Shortly thereafter the atmosphere inside the tower exploded; thirteen men were killed and others injured. The record does not indicate whether the lighting system contributed to the explosion.

In order to prove that an employer committed a violation, the Secretary must show, inter alia, that the employer knew, or in the exercise of reasonable diligence, could have known of the violative condition. Prestressed Systems, Inc., 81 OSAHRC 43/D5, 9 BNA OSHC 1864, 1981 CCH OSHD ¶ 25,358 (No. 16147, 1981); General Electric Co., 81 OSAHRC 42/A2, 9 BNA OSHC 1722, 1981 CCH OSHD ¶ 25,345 (No. 13732, 1981). We conclude, based on the record before us, that the Secretary has not made out a prima facie showing that Delta Field knew or in the exercise of reasonable diligence could have known that the lights were being operated in excess of the permitted voltage.

The only evidence bearing on Delta Field's actual knowledge regarding voltage is the testimony of its two supervisory employees. The night superintendent testified variously that the transformers were "supposed" to be marked for voltage, that "some were not marked," that none was marked, and that he was not sure whether any were marked.[2/] The day superintendent testified that he had never looked at the transformers so could not say whether they were marked, but that in any case he would not have understood the significance of any markings because he has no electrical expertise. Tenneco's own electrician testified at the hear-

---

2/ Delta Field's night superintendent testified as follows:

> Q. Would you know what wattage the lights were?
> A. Twelve volts.
> Q. Excuse me, I didn't hear your answer?
> A. I am sure that they were 12 volts.
> Q. You say that you are sure. Do you know that they are 12 volts?
> A. I don't know if I was sure. They were connected to the boxes outside, and I am pretty sure that they were 12 volts.
> Q. Did you examine those light fixtures to determine what they were?
> A. Yes, you could.
> Q. How could you tell what the voltage was from those light fixtures?
> A. It's suppose [sic] to be marked on the boxes that they are plugged into because they are a reducer box. They are plugged into one thing and they are reduced down to 12 volts.
> Q. Did you ever look at the boxes to determine whether they were 12 volts?
> A. No, I didn't, but I would assume they were. That's what they were suppose [sic] to be.
> Q. Could you have looked at those boxes to determine whether they were reducing boxes?
> A. Yes, sir. I'm not sure if its [sic] marked on there or not. Some of the boxes don't have any markings on them.
> Q. But the question is, "Were these boxes available to you so that you could tell what was on them?"
> A. Yes, they were.

ing that the system had included both 32 and 110-volt wiring but was never asked how he made that determination. Consequently, his testimony provides no basis for an inference that the equipment was visibly marked for voltage.

Nor did the Secretary prove that Delta Field failed to exercise reasonable diligence to discover the voltage at which the lights were operating. A contractor entering another employer's facility would not ordinarily be concerned with the voltage of the lights,[3/] and the Secretary has not established any reason why Delta Field should not reasonably have relied on Tenneco, which controlled the facility and employed electricians, to assure that the lighting system was operating at an appropriate number of volts.[4/]

Accordingly, we vacate the citation[5/] on the ground that the

---

3/ We note that the general industry standards regulate electrical equipment and wiring in hazardous locations but set no limit on voltage per se in such locations. See 29 C.F.R. § 1910.307 and the National Electrical Code, NFPA 70.

4/ The record indicates that it was Tenneco's practice to provide all equipment and tools used by Delta Field on Tenneco's premises and that Delta Field was contractually prohibited from bringing electricians to the refinery.

5/ Commissioner Cottine dissents to the Commission decision in this case. Commissioner Cottine notes that under the Occupational Safety and Health Act each employer is principally responsible for the safety of its own employees. Central of Georgia R.R. Co. v. OSHRC, 576 F.2d 620 (5th Cir. 1978); Frohlick Crane Service, Inc. v. OSHRC, 521 F.2d 628 (10th Cir. 1975); Sam Hall & Sons, Inc., 80 OSAHRC 106/A2, 8 BNA OSHC 2176, 2179 n.8, 1980 CCH OSHD ¶ 24,927 at p. 30,744 n.8 (No. 76-4988, 1980); Camden Drilling Co., 78 OSAHRC 33/A2, 6 BNA OSHC 1560, 1978 CCH OSHD ¶ 22,687 (No. 14306, 1978); Grossman Steel & Aluminum Corp., 76 OSAHRC 54/D9, 4 BNA OSHC 1185, 1975-76 CCH OSHD ¶ 20,691 (No. 12775, 1976). 5/ (continued)

is no defense that someone else . . . agreed to look out for the employee's job safety." Bayside Pipe Coaters, Inc., 74 OSAHRC 67/B14, 2 BNA OSHC 1206, 1206-7, 1974-75 CCH OSHD ¶ 18,677 at p. 22,578 (No. 1953, 1974).

Delta Field had a regular maintenance crew working at the Tenneco refinery on a year-round basis. Both Delta Field superintendents on the Tower 103 job had prior experience working in vessels similar to Tower 103 and were accustomed to dealing with Tenneco's electricians, who were readily available for consultation. The provision of electric lighting was integral to the work Delta Field's employees were performing within the tower. Under these circumstances, the exercise of reasonable diligence would have required, at a minimum, that Delta Field inquire whether the electrical equipment supplied by Tenneco for use by Delta Field's employees in a hazardous location complied with the requirements of the Act.

6/ Delta Field has raised other objections to the judge's disposition of this item, but inasmuch as our ruling is dispositive of the case, we will not consider them here.

## DECISION AND ORDER

APPEARANCES:

Harvey M. Shapan, Esquire, Office of the Solicitor, U. S. Department of Labor, Dallas, Texas, on behalf of complainant.

Horace A. Thompson, III, Esquire, Jones, Walker, Waechter, Poitevent, Carrere & Denegre, New Orleans, Louisiana, on behalf of respondent.

## STATEMENT OF CASE

Burroughs, Judge: This is a proceeding initiated pursuant to section 10(c) of the Occupational Safety and Health Act of 1970, 29 U.S.C. 651 et seq., 84 Stat. 1590 ("Act"). Respondent timely contested two serious citations issued to it by complainant on September 14, 1976, pursuant to section 9(a) of the Act. Review is also sought of the penalties proposed for the alleged violations.

Respondent is a corporation having a place of business and office at Baton Rouge, Louisiana. It is engaged in the construction business. The citations emanated from an investigation conducted during the period from August 13, 1976, to September 13, 1976, at the Chalmette, Louisiana, refinery of Tennessee Oil Company (Tenneco).

Serious citation number one alleges that respondent violated section 5(a)(2) of the Act by failing to comply with the safety standard published at 29 C.F.R. § 1926.401(j)(4). The citation described the alleged violation as follows:

> "Portable electric lighting used in hazardous location(s) was operated at more than 12 volts:
>
> (a) in that the employer allowed electricity of 120 volts to be in the inside of the vessel."

A penalty of $600 was proposed for the alleged violation.

Serious citation number two alleges that respondent violated section (5)(a)(1) of the Act. The alleged violation was described as follows:

> "The employer did not furnish employment and a place of employment free from recognized hazards that caused or were likely to cause death or serious physical harm to his employees in that the employer did not allow employees exposed to dangerous concentrations of flammable vapors to leave the hazardous area immediately and remain clear of the area until tower A-103 had been determined safe for re-entry."

A penalty of $600 was proposed for the alleged 5(a)(1) violation.

Respondent timely contested the two serious citations, including the abatement dates and proposed penalties, by a letter dated September 24, 1976, from its counsel. A hearing was held in the case on March 3 and 4, 1977, in New Orleans, Louisiana. No additional parties desired to intervene in the proceeding.

After complainant had presented all of his evidence and rested, counsel for respondent moved to dismiss the citations. The motion to dismiss was granted as to the 5(a)(1) violation but was denied as to the serious violation of 29 C.F.R. § 1926.401(j)(4) (Tr. 255-264).

## JURISDICTION AND ISSUES

Respondent concedes that it is engaged in a business affecting commerce within the meaning of the Act and that the Commission has jurisdiction of the parties and of the subject matter presented in this proceeding (Paras. I, II, Complaint and Answer).

The following issues are presented to the Commission for determination:

1. Did respondent violate section 5(a)(2) of the Act by failing to comply with the safety standard set forth at 29 C.F.R. § 1926.401(j)(4)?
2. Did respondent violate section 5(a)(1) of the Act by failing to allow employees exposed to dangerous concentrations of flammable vapors to leave the area and remain clear until the area was safe for re-entry?
3. Were the violations, if they occurred, serious within the meaning of section 17(k) of the Act?
4. What penalties, if any, should be assessed for any violations determined to have occurred?

## FINDINGS OF FACT

The following facts are specifically determined in resolving the issues in dispute:

1. Respondent is a corporation having a place of business and office at Baton Rouge, Louisiana. It is engaged in the construction business (Para. II, Complaint and Answer).

2. On Wednesday, August 4, 1976, there was a buckling or bending of some of the trays in tower A-103 at the Tenneco refinery plant in Chalmette, Louisiana (Tr. 8 - Stipulated by parties).

3. The trays, which are used in a type of filtering process, had to be removed and straightened. Prior to commencing the work, ethylbenzene had to be purged from the tower. Steam was forced into the tower and removed. Nitrogen was put into the tower and then compressed air was put into the tower to remove the nitrogen. Once these steps were completed, the tower was considered safe for working and was tagged safe by the Tenneco safety department (Tr. 8-9, Stipulated by parties).

4. The Tenneco safety department placed a tag on the bottom manway of tower A-103 indicating that it was safe to work inside and inspected the tower each day for gas (Tr. 35, 36, 58). Every time an inspector checked the tower he placed the time and date on the tag (Tr. 57-58, 60).

5. On Friday, August 6, 1976, employees of Tenneco started at the top of the tower and began removing trays as they moved downward inside the tower. Delta Field Erection, Inc., was hired by Tenneco to perform the work in replacing the trays. As the Tenneco employees moved down the tower, employees of Delta Field Erection, Inc , were to move behind the Tenneco employees and replace the trays (Tr. 9 - Stipulated by the parties; Tr. 19, 272-273).

6. Employees of Delta Field Erection commenced the work of replacing the trays in tower A-103 on Monday, August 9, 1976. The job of replacing the trays was continued on August 10, 11 and 12, 1976 (Tr. 19-20, 71, 97-98, 132-133, 272). Respondent only employed boilermakers and laborers

for the job (Tr. 276).

7. Manways leading to the inside of tower A-103 were circular and had a diameter of approximately 20 inches (Tr. 58-59). The tower had eight levels and a manway was located on each level (Ex. 6; Tr. 59).

8. Scaffolds were constructed inside the tower at the manways to provide a working surface for employees (Tr. 9 - Stipulated by the parties; Tr. 178-179).

9. On August 9, 1976, Richard Sutton was a superintendent for Delta Field Erection, Inc., and was in charge of the night shift of employees working at the Tenneco refinery. The night shift commenced work at 4:30 p.m. (Tr. 18-19, 69). The only duty performed by the night shift was the replacement of the trays in tower A-103 (Tr. 20, 97-98,132-133).

10. On August 9, 1976, Sutton checked all the lines going into tower A-103 to insure there was no gas leaking into the tower (Tr. 35-36). Tenneco personnel had inserted plates in all the pipes to block off any flow of gas into the tower (Tr. 48-49).

11. On August 12, 1976, employees of Tenneco were removing trays on the first, second, third and fourth levels. Employees of Delta Field Erection were working on the fifth, sixth, seventh and eighth levels of the tower (Tr. 9 - Stipulated by the parties; Ex. 6; Tr. 71-72, 132, 289).

12. Sutton arrived at the Tenneco plant on August 12, 1976, around 4:00 p.m. Upon arrival, he coordinated matters with the day-shift superintendent, Jessie Jenkins. They discussed the progress of the job. Jenkins and Sutton went to tower A-103. Sutton looked inside the tower to see where the men were working, but he did not go inside the tower (Tr. 21-22, 44, 68).

13. On August 12, 1976, there was a tag on the bottom manway of tower A-103 indicating that it was safe for personnel to work inside. Sutton noticed the tag on August 12, 1976, but did not read it (Tr. 35, 44, 57).

14. On the evening of August 12, 1976, the wind was blowing sulfur fumes from the stacks of nearby heaters into the vicinity of tower A-103 (Tr. 45, 80, 95, 114). The fumes were quite strong and made it difficult to breath on the outside of the tower (Tr. 46, 59, 95, 127, 141).

15. Huey Cantrell was the night-shift boilermaker foreman. He proceeded to get the night-shift employees working when they arrived on the site (Tr. 22-23, 62). He was in charge of seeing that employees were doing the job. He had authority to assign work to employees and to move them from one place to another (Tr. 24, 62-63).

16. Huey Cantrell was not a permanent employee of respondent. Boilermakers are hired through the union hall and a foreman is usually sent with the men. Cantrell commenced work at the site on Wednesday, August 11, 1976. He was specifically requested to replace the foreman originally sent out by the union hall (Tr. 55, 62).

17. Between 6:00 p.m. and 6:30 p.m., Sutton went into tower A-103 to check the progress and stopped to talk to each employee. He detected no unusual odor while he was inside the tower. He left the tower around 7:00 p.m. and went to his office which was located approximately a half mile from the tower (Tr. 28-29, 37, 43-44).

18. On August 12, 1976, employees of respondent, Mike Cantrell, Larry Cantrell, Ralph Douglas, E. R. Smith and Carl Dagreport, were working on the fifth level inside tower A-103 on the night shift (Ex. 6; Tr. 97-98, 221).

19. When Mike Cantrell commenced work on August 12, 1976, the odor inside the tower was the same as the day before (Tr. 99).

20. Sometime around 7:00 p.m. on August 12, 1976, Mike Cantrell thought he detected an unusual odor in the tower. He and his co-workers discussed the possibility of an unusual odor. The co-workers indicated that they were somewhat lightheaded or dizzy but did not smell any unusual odor. Cantrell also felt some dizziness (Tr. 80, 100-102, 127-128, 135-136, 227, 237).

21. Mike Cantrell, Ralph Douglas, Larry Cantrell and Carl Dagreport got out of the tower onto the catwalk because they were getting dizzy. Smith was already on the catwalk outside the manway (Tr. 102-103, 127, 227).

22. Mike Cantrell decided to leave the tower and talk to the supervisors about the possibility of an unusual odor being present. As he descended the tower, he mentioned the odor to a Tenneco employee. The Tenneco employee informed him that the trays had been in the tower a long time and that vapors were caused by moving them around. He indicated that this was the possible source of the odor (Tr. 102-103, 105-106, 129-130, 136, 221).

23. Upon reaching the ground, Mike Cantrell went to get a drink of water and encountered Frank Davis, the union steward. Davis asked what was the matter. Mike Cantrell told him "we smelled fumes and got dizzy" and that he was on his way to tell his daddy (Huey Cantrell) and the supervisors (Tr. 106, 112, 121, 148, 157-158, 159-160, 161, 172-173).

24. At approximately the same time that Mike Cantrell was on the way to the ground, employees at the top of the tower called down to

Frank Davis and informed him that they smelled gas. Davis went into the Tenneco operator's office and informed them about the gas smell. He also went looking for Huey Cantrell. When Davis arrived back at his station, he ran into Mike Cantrell who was on the way to inform his father of the fumes (Tr. 156-157, 159, 166, 167-168, 169-172, 175).

25. Huey Cantrell and George Verger, superintendent for Tenneco, were standing a few feet from the water cooler. After talking to Frank Davis, Mike Cantrell approached his father and Verger. Davis followed him (Tr. 106-107, 148-149).

26. Mike Cantrell informed his father and the others in the group that "we smelled fumes" so bad that they could hardly breathe. He did not indicate to his father that he or any of his co-workers felt dizzy. The group with whom Mike Cantrell conversed included Frank Davis, Huey Cantrell and George Verger (Tr. 73-74, 76-79, 80, 84, 85, 107-109, 112, 114, 121, 124, 148-149). Davis also mentioned the complaint he had received from other employees complaining of smelling gas (Tr. 169, 172).

27. Mike Cantrell only informed Frank Davis that he and his co-workers were lightheaded or dizzy (Tr. 109, 112).

28. After Mike Cantrell made his statement concerning the fumes, Huey Cantrell and Frank Davis asked George Verger about the condition. Verger indicated that the employees were smelling sulfuric furnace fumes blowing into the area from the nearby heaters and that Tenneco personnel often had to work under those conditions. Verger stated that it was safe for the employees inside the tower and that the fumes would subside when the wind changed directions. According to Verger, there was no way gas could

get into the tower, and he suggested Mike Cantrell might put a blower inside the tower (Tr. 78-80, 107, 112, 114, 140, 151, 162).

29. Huey Cantrell was aware of the sulfuric fumes at the manways up and down the exterior of the tower (Tr. 84, 94). He surmised that anyone close to the manways might smell the sulfur fumes (Tr. 94-95).

30. Frank Davis asked Huey Cantrell whether he wanted to pull the men off the job. Cantrell accepted Verger's explanation and told them to go back to work. Mike Cantrell then turned and went back to the tower (Tr. 80, 107, 108, 114, 123, 161, 167). Tenneco did not check the tower for fumes at that time (Tr. 80-81).

31. When Mike Cantrell left the group, he tried to find a blower but could not find one with a proper fitting for an air hose. He decided to forget about the blower until lunch and returned to the tower to commence work. Within seconds after Mike Cantrell went inside the tower, an internal explosion occurred (Tr. 114, 123, 140-141, 143, 234). The explosion occurred some 15 to 20 minutes after he had talked to his father (Tr. 155).

32. Thirteen persons died as a result of the internal explosion in tower A-103 (Tr. 43).

33. Huey Cantrell had one son killed in the explosion and one son seriously injured (Tr. 85).

34. Eric Monette, a laborer employed by Tenneco, was working on the second level in tower A-103 on August 12, 1976 (Tr. 203).

35. About a half an hour to an hour prior to the explosion, Monette was instructed to hook up an air blower on the first level to keep the air

circulating in the tower (Tr. 204, 206-207).

36. There were three valves on the first level. One of them was to an air line. None of the valves were marked. Monette opened one of the valves and thought air came out. He surmised that he had the right line and connected the air blower to it (Tr. 204-205). The line to which the air blower was connected was a natural gas line (Ex. 5; Tr. 207-208, 209-210).

37. An investigation after the explosion disclosed that an air hose leading into the tower had been connected to a natural gas line (Tr. 49).

38. The natural gas had no odor (Tr. 252, 253).

39. Huey Cantrell went inside tower A-103 on three occasions on August 12, 1976, prior to the explosion (Tr. 65-68). He detected no unusual odors (Tr. 73).

40. Sutton detected the same odor in tower A-103 from the time the job commenced on August 9, 1976, to the time the explosion occurred on August 12, 1976 (Tr. 43).

41. A short time prior to the explosion, Sutton returned to the vicinity of tower A-103 to talk with Huey Cantrell. While Sutton was talking with Cantrell, Carl Dagreport walked up and informed him that he smelled gas in tower A-103 (Tr. 29-31). During the time Dagreport was talking with Sutton, the internal explosion occurred inside tower A-103 (Tr. 30-31, 42, 44). The explosion occurred around 7:30 p.m. (Tr. 44).

42. Prior to Dagreport informing Sutton that he smelled gas inside tower A-103, Sutton had received no complaints from employees about gas being inside the tower (Tr. 32).

43. There is a recognized hazard to employees working in a tower, such as tower A-103, with natural gas in it (Tr. 209 - Stipulated by parties).

44. Tenneco had safety personnel at the site and made the decision as to when it was safe for employees to work inside the tower (Tr. 33-34, 36, 275).

45. Tenneco did not permit employees of respondent to work within its plant facilities until its safety personnel checked to see that it was safe to work in the area (Tr. 34, 36, 275).

46. Respondent relied upon Tenneco and did not consider it necessary to hire a safety specialist to check behind Tenneco safety personnel to see if they were accurate in their job (Tr. 34).

47. Respondent had no safety director or personnel at the Tenneco site from August 9 through August 12, 1976 (Tr. 33). Sutton was responsible for the safety of respondent's employees at the site (Tr. 33-34).

48. Respondent had no equipment at the site to test for gas inside the tower (Tr. 81).

49. Respondent's superintendents were responsible to the Tenneco maintenance superintendent (Tr. 273).

50. A heavy sulfur smell was present on the morning of August 13, 1976, when the compliance officer commenced his investigation (Tr. 245).

51. Tenneco personnel installed all lighting systems used by respondent inside tower A-103. Respondent's superintendent requested the lights from the appropriate Tenneco official and that official sent personnel to install the lights (Tr. 25-26, 69, 183, 188, 275-276). Respondent employed no electricians at the site (Tr. 276) and had no authority to modify the

electrical system installed for it by Tenneco personnel (Tr. 279).

52. Tenneco used 32-volt transformers to supply the lighting for the inside of tower A-103 (Tr. 184, 185-186, 194, 195, 197).

53. Two drop cord lights were being used by respondent's employees inside the tower on August 12, 1976, at the fifth level (Tr. 125-126, 144, 180, 183, 188, 198). One of the drop cord lights on the fifth level was 110 volts (Tr. 189-191, 196, 200).

54. Sutton was aware of the type of lighting being used inside the tower. He assumed the lights were 12 volts. He did not look to see if the drop lights contained more than 12 volts (Tr. 26-27).

55. Respondent's day superintendent, Jesse Jenkins, went into tower A-103 on an average of two to three times a day but never undertook to ascertain the amount of voltage being used for the lights. The transformers were located outside the tower on the manways (Tr. 277, 281-283). He observed the transformers and assumed that there was some reduction in the voltage but never inquired about it (Tr. 296).

## OPINION

This case emanates from an explosion occurring on August 12, 1976, in a vessel known as tower A-103 at the Tenneco refinery located at Chalmette, Tennessee. The explosion occurred because a Tenneco employee inadvertently connected up an air hose to a natural gas line and then directed the flow of gas into the tower. He had been instructed to hook up an air blower in order to get more air circulation inside the tower.

Respondent had employees working at the four top levels within the tower and Tenneco employees were working the lower levels. Tenneco

employees were removing warped trays inside the tower, and respondent's employees were replacing the trays that had been removed. As a result of an investigation conducted of the explosion, respondent was issued two serious citations alleging violations of section 5(a)(1) and 5(a)(2) of the Act. The alleged 5(a)(2) violation resulted from the failure to comply with the safety standard published at 29 C.F.R. § 1926.401(j)(4).

I. Alleged Violation of Section 5(a)(1)

Complainant alleges that respondent violated section 5(a)(1)[1/] of the Act by not allowing employees exposed to dangerous concentrations of flammable vapors inside tower A-103 to leave the hazardous area immediately and remain clear until the tower had been determined to be safe for re-entry.

In order to establish a serious violation of section 5(a)(1) of the Act, complainant must prove: (1) that respondent failed to render its workplace free of a hazard; (2) the hazard was "recognized" and (3) it caused or was likely to cause death or serious physical harm. National Realty & Construction Co., Inc. v. O.S.H.R.C., 489 F.2d 1257, 1264 (D.C. Cir. 1973). See also American Smelting & Refining Co. v. O.S.H.R.C., 501 F.2d 504 (8th Cir. 1974); Brennan v. O.S.H.R.C. & Vy Lactos Lab, Inc., 494 F.2d 460 (8th

---

1/ Section 5(a)(1) of the Act reads as follows:

> "Each employer—
> (1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees;"

Cir. 1974). Section 5(a)(1) only requires an employer to discover and exclude from the workplace preventable hazards. Getty Oil Company v. O.S.H.R.C. and Dept. of Labor, 530 F.2d 1143 (5th Cir. 1976).

The explosion and subsequent death of several employees are uncontroverted evidence that the workplace was not free of a hazard that was likely to cause death or serious physical harm. When these facts are construed with the stipulation of the parties that the natural gas in the tower was a recognized hazard, it would appear that a section 5(a)(1) violation has been established. However, it is clear that Congress did not intend to punish an employer for what he had no reason to know was a dangerous situation. Knowledge of the existence of a violation is an essential element of any violation determined under the Act. Mountain States Telephone & Telegraph Co., 73 OSAHRC 1/A9, 1 BNA OSHC 1077, 1971-1973 CCH OSHD ¶ 15,365 (1973). "Therefore, the evidence must establish that respondent knew or, with the exercise of reasonable diligence, should have known of the existence of the violation." North American Rockwell Corp., 75 OSAHRC 43/A6, 2 BNA OSHC 1710, 1974-1975 CCH OSHD ¶ 19,464 (1975), aff'd 540 F.2d 1283 (6th Cir. 1976).

Prior to employees of respondent entering tower A-103, employees of Tenneco's safety department had conducted tests for gas within the tower. The tests indicated the tower was safe to work within and a tag was placed at the bottom manway indicating that it was safe for employees. Tenneco's safety personnel made daily checks for the possibility of gas within the tower. These tests were made for the protection of its own employees as well as those of respondent since both of them had employees working within the tower.

Respondent was not permitted by Tenneco to work in any areas of its facilities until Tenneco safety personnel had checked to see that the area was safe. There is no evidence to indicate that Tenneco's safety personnel were not qualified to conduct the testing within the tower in a competent manner. There was no reason for respondent to duplicate the work of Tenneco's safety personnel since it had no reason to assume that Tenneco would expose its own employees in the tower to a hazard. Respondent was entitled to assume that the test results were accurate and was not abdicating its responsibililty to its employees by relying on Tenneco personnel. The fact that Tenneco safety personnel performed the testing is similiar to respondent employing a competent third party to perform testing before it permitted its employees to work within the tower. If a competent third party had been employed by respondent to do the testing, complainant certainly would not argue that respondent had abdicated its responsibility to its employees. Since no evidence was presented to show that Tenneco personnel were incompetent to make judgments as to the working conditions within the tower, respondent was entitled to rely upon the judgment of Tenneco personnel.

Respondent's employees commenced work inside the tower on August 9, 1976. Richard Sutton, respondent's night-shift foreman, checked all the lines going into the tower on August 9, 1976, to insure that there was no gas leaking into the tower. Sutton found that Tenneco personnel had inserted plates in all the pipes to block off any flow of gas into the tower. The inspection of the pipes by Sutton and the fact that the tower had been tagged safe were certainly sufficient for him to conclude that it was safe

for his personnel. One must also bear in mind that employees of Tenneco had commenced working in the tower on August 6, 1976, which was the Friday prior to respondent's employees commencing on the following Monday. Tenneco personnel had worked inside the tower at least one full day prior to respondent's employees commencing work. Respondent was obviously aware of this fact. Some trays had to be removed prior to respondent being able to accomplish the job for which it was hired.[2/]

No problems arose on the job on August 9, 10 and 11, 1976. Sometime around 7:00 p.m. on August 12, 1976, Mike Cantrell, an employee of respondent, thought he detected an unusual odor in the tower. He discussed the matter with his co-workers and discovered that they were all a little dizzy. They walked out of the tower onto the catwalk. Mike Cantrell then decided to leave his work station and go talk to his father about the condition. He descended the tower and sought out Huey Cantrell (his father), who was the night-shift boilermaker foreman. In the process of looking for his father, Mike Cantrell encountered Frank Davis, the union steward. He informed Davis that he and his co-workers smelled fumes inside the tower and had gotten dizzy. Just prior to encountering Cantrell, Davis had been advised by workers at the top of the tower that they smelled gas.[3/] At the time he encountered Mike Cantrell, Davis was also looking for Huey Cantrell to inform him of the existing conditions.

---

2/ Respondent was hired to replace the trays as they were removed by Tenneco personnel.

3/ The record does not indicate who informed Davis that they smelled gas.

Mike Cantrell approached his father and Davis followed him. Huey Cantrell was talking with George Verger, superintendent for Tenneco, at the time his son approached him. There is some confusion as to exactly what Mike Cantrell told his father. In a statement given to the compliance officer on January 7, 1977 (Ex. 7), he stated he informed his father that he and the other employees had become dizzy. However, during the trial he testified that he informed his father that they smelled fumes and that he failed to mention the fact that they were dizzy. He testified that he had met Frank Davis, the union steward, prior to approaching his father and had informed him that he and his co-workers were lightheaded or dizzy. Davis confirms that he and Mike Cantrell met prior to Mike Cantrell reaching his father. The statement makes no reference to his having met and talked with Frank Davis.

The statement given by Mike Cantrell to the compliance officer indicates that he informed his father that he and his co-workers were dizzy; whereas he testified that he mentioned this fact to Frank Davis. It is obvious the statement is incorrect since it does not mention Frank Davis, and Davis confirms that he and Mike Cantrell had a conversation prior to Mike Cantrell talking with his father. Mike Cantrell was seriously injured in the explosion. He spent some 72 days in the hospital and underwent four operations (Tr. 131). It was obviously a painful experience to have to recall the events leading up to the explosion. This Judge was impressed with his demeanor and responses to the questions. His testimony is considered to be truthful and reliable.

Mike Cantrell informed his father that he and his co-workers smelled fumes so bad that they could hardly breathe. Davis informed Huey Cantrell and Verger that other employees had complained of smelling gas. Huey Cantrell and Davis asked Verger about the possible cause of the condition. Verger informed them that the employees were smelling the sulfuric furnace fumes blowing into the area from the nearby heaters and that this condition was not unusual. He informed Cantrell and Davis that there was no way gas could get inside the tower and that the tower was safe for the employees. Verger suggested that Mike Cantrell put another air blower inside the tower.

Huey Cantrell accepted Verger's explanation and told his son to go back to work. Mike Cantrell had no reason to question his father's judgment. The wind was blowing sulfur fumes into the vicinity of the tower and it was difficult to breathe on the outside of the tower. The employees were aware of the strong fumes.[4/] Huey Cantrell had also smelled the sulfuric fumes at the manways up and down the exterior of the tower and surmised that anyone close to the manways might smell the sulfur fumes inside the tower.

The explanation by Verger was also logical from his standpoint. The tower had been tagged as being safe. Plates had been inserted in all pipes to block off any flow of gas into the tower. In addition, the natural gas had no odor. Thus, employees could not have been smelling the natural gas. The

---

4/ Mike Cantrell testified that when he returned to the tower the sulfur fumes outside on the catwalk were so strong that it parched his throat. His brother told him that he was going back into the tower because he couldn't stand it outside (Tr. 141).

sulfuric fumes were quite strong and employees were undoubtedly exposed to some of the fumes inside the tower. There is no competent evidence to indicate that Verger or Huey Cantrell were aware that the employees working inside the tower were becoming dizzy.

The explosion was caused by a totally unexpected and unforeseen occurrence. A Tenneco employee inadvertently connected an air blower to a natural gas line. This was not something that Huey Cantrell could have foreseen. He had no indication that there could be any gas in the tower. If he had had such information, it is certain that he would not have instructed his son to go back into the tower. Obviously, he would not have knowingly exposed his sons to such a hazard.[5/] His testimony makes this point quite clear. He testified (Tr. 85-86):

> "Q You might consider this speculative, but I think it is a pertinent question. What would you have done if your son had told you that he felt dizziness or anybody told you that he felt dizzy?
>
> A I'd like to make a statement to this Court, since you asked this question, if you don't mind. Your Honor can I make this statement?
>
> JUDGE BURROUGHS: Sure.
>
> THE WITNESS: You can believe me, if I had any inkling, anything would have been wrong on that job, I would have grabbed my two kids and got just as far away from it as I could. You can believe that because I have been through, I have got one dead over this and one buried and I have been seven months of living hell since it happened. You can believe, my friend, I would have gotten my boys out of there. I had no idea that there was gas, nowhere in the vicinity even that would cause this kind of disaster."

---

5/ Huey Cantrell had one son killed and other son seriously injured as a result of the explosion.

It must also be kept in mind that Huey Cantrell went inside the tower on three occasions prior to the explosion and detected no unusual odors.

Richard Sutton, respondent's night-shift superintendent, was the other supervisory employee of respondent on duty at the time of the explosion. He was in charge of the night shift. He had personally checked the gas lines leading into the tower at the time his employees commenced on the job on August 9, 1976, and found that plates had been inserted in the pipes to block off any flow of gas. When Sutton reported for work on August 12, 1976, he coordinated matters with the day-shift superintendent. He did not go inside the tower at that time but looked inside it to see where the men were working. He noticed the tag on the bottom manway indicating it was safe for personnel to work.

Sometime between 6:00 p.m. and 6:30 p.m., Sutton went inside the tower to check on the progress of the employees. He stopped to talk with each employee and left the tower sometime around 7:00 p.m. He detected no unusual odor in the tower. A short time prior to the explosion, Sutton returned to the vicinity of the tower and conversed with Huey Cantrell. While Sutton was talking with Cantrell, Carl Dagreport walked up and said that he smelled gas in the tower. At about that time the internal explosion occurred. This was the first complaint that Sutton had received about smelling gas in the tower. He had no time in which to take action prior to the explosion.

Complainant alleges that respondent "did not allow employees exposed to dangerous concentrations of flammable vapors to leave the hazardous area immediately." The difficulty with the allegation is that there is no

evidence that anyone in a supervisory position was aware that there were flammable vapors inside the tower. The explosion emanated from a totally unexpected and inadvertent act of a Tenneco employee. The fact that sulfur fumes were blowing into the area and the knowledge that all gas pipes leading into the tower had been blocked undoubtedly led Verger to his conclusion that there was no danger to employees. The employees could not have been smelling gas since it had no odor.[6/] The motion to dismiss the allegation is granted.

II. Alleged Violation of 29 C.F.R. § 1926.401(j)(4)

Complainant alleges that respondent violated 29 C.F.R. § 1926.401(j)(4)[7/] by using portable lighting inside tower A-103 of 120 volts. The standard requires portable lighting inside such a tank or vessel be operated at a maximum of 12 volts. The evidence fully supports the violation.

All lighting inside the tower was installed by Tenneco personnel. Respondent's superintendent requested lights from the appropriate Tenneco official. There is no evidence that any official of respondent specified that the lighting used had to be operated at a maximum of 12 volts. Tenneco used

---

6/ The fact that the natural gas had no odor undoubtedly led the Tenneco employee into thinking he was connecting the air blower to an air line. He testified that he opened up the line and air came out (Tr. 204-205).

7/ 29 C.F.R. § 1926.401(j)(4) states:

> "Portable electric lighting used in moist and/or other hazardous locations, as for example, drums, tanks, and vessels shall be operated at a maximum of 12 volts."

32-volt transformers to supply the lighting inside the tower. In addition, at least one drop cord light using 110 volts was being used by respondent's employees.

Respondent argues that it did not have control over the workplace and should not be held responsible for the violation. It relies upon the rationale of the Commission in Anning-Johnson Co., 4 BNA OSHC 1193, 1975-76 CCH OSHD ¶ 20,690 (nos. 3694 & 4409, 1976) and Grossman Steel & Aluminum Corp., 4 BNA OSHC 1185, 1975-75 CCH OSHD ¶ 20,691 (no. 12775, 1976). The difficulty with this argument is that respondent's day-and-night-shift superintendents never requested a 12-volt system and made no effort to ascertain what type of transformer was being used. Respondent's day superintendent, Jesse Jenkins, acknowledged that if he had been aware that the lighting system inside the tower exceeded 12 volts, he could have conversed with the proper Tenneco personnel to get the situation corrected (Tr. 277-278).

The violation has been established.

III. Nature of Violation of 29 C.F.R. § 1926.401(j)(4)

Complainant alleges that the violation of 29 C.F.R. § 1926.401(j)(4) was serious within the meaning of section 17(k) of the Act.[8/] The Commission

---

8/ Section 17(k) of the Act states:

> "For purposes of this section, a serious violation shall be deemed to exist in a place of employment if there is a substantial probability that death or serious physical harm could result from a condition which exists, or from one or more practices, means, methods, operations, or processes which have been adopted or are in use, in such place of employment unless the employer did not, and could not with the exercise of reasonable diligence, know of the presence of the violation."

has held on numerous occasions that the occurrence of an accident because of an existing hazard in violation of the Act does not have to be substantially probable in order to be classified a serious violation. An accident must simply be possible. Serious and non-serious violations "are distinguished on the basis of the seriousness of injuries which experience has shown reasonably likely to occur." Natkin and Company, 73 OSAHRC 16/E3, 1 BNA OSHC 1204, 1971-1973 CCH OSHD ¶ 15,679 (1973). The probability of an accident occurring is relevant only to the gravity of the violation. See Emory H. Mixon, 73 OSAHRC 57/D11, 1 BNA OSHC 1500, 1973-1974 CCH OSHD ¶ 17,027 (1973).

Employees of respondent were for the most part using lights that operated off a 32-volt transformer. However, at least one drop cord light operated at 110 volts. While there is no evidence that there were moist conditions inside the tower, the use of a 110-volt drop cord light in the tower is considered to be a serious violation. There was danger of a severe electrical shock that could have resulted in death or serious physical injury. Respondent, with the exercise of reasonable diligence, could have discovered the violation.

## IV. PENALTY DETERMINATION

The Commission is the final arbiter of penalties in all contested cases. Secretary v. Occupational Safety and Health Review Commission and Interstate Glass Co., 487 F.2d 438 (8th Cir. 1973). Under section 17(j)[9/]

9/ Section 17(j) of the Act states:

> "The Commission shall have authority to assess all civil penalties provided in this section, giving due consideration to the appropriateness of the penalty with respect to the size of the business of the employer being charged, the gravity of the violation, the good faith of the employer, and the history of previous violations."

of the Act the Commission is required to find and give "due consideration" to the size of the employer's business, the gravity of the violation, the good faith of the employer and the history of previous violations in determining the assessment of an appropriate penalty. The gravity of the offense is the principal factor to be considered. Nacirema Operating Company, Inc., 72 OSAHRC 1/B10, 1 BNA OSHC 1001, 1971-1973 CCH OSHD ¶ 15,032 (1972).

Respondent had several employees working inside the tower during both shifts. Most of them were apparently using lights operating off of the 32-volt transformers. Only one 110-volt drop cord light was known to be in use. A penalty of $300 is deemed appropriate for the violation.

## CONCLUSIONS OF LAW

1. Respondent, at all times material to this proceeding, was engaged in a business within the meaning of section 3(5) of the Act.

2. Respondent, at all times material to this proceeding, was subject to the requirements of the Act and the standards promulgated thereunder. The Commission has jurisdiction of the parties and of the subject matter herein.

3. On August 12, 1976, respondent had employees working in tower A-103 at the Tenneco refinery plant in Chalmette, Louisiana.

4. An internal explosion occurred in tower A-103 on August 12, 1976, as a result of a Tenneco employee inadvertently connecting an air blower to a natural gas line and directing the flow into the tower. Respondent was unaware that natural gas was inside the tower, and previous precautions had been taken to insure that no gas got inside the tower. Respondent was not in violation of section 5(a)(1) for failing to permit its employees to leave the

tower since it was unaware of dangerous concentrations of flammable vapors inside the tower.

5. On August 12, 1976, employees of respondent were utilizing lights operated above the maximum of 12 volts allowed by 29 C.F.R. § 1926.401(j)(4). The violation was serious. A penalty of $300 is assessed for the violation.

## ORDER

Upon the basis of the foregoing findings of fact and conclusions of law, it is

ORDERED: (1) That the serious citation and proposed penalty issued to respondent on September 14, 1976, alleging a violation of section 5(a)(1) of the Act are vacated;

(2) That the serious citation issued to respondent on September 14, 1976, alleging a violation of 29 C.F.R. § 1926.401(j)(4) is affirmed; and

(3) That the penalty proposed for the serious violation of 29 C.F.R. § 1926.401(j)(4) is modified to assess a penalty of $300.

Dated this 21st day of September, 1977.

|---|---|
| SECRETARY OF LABOR,<br>Complainant,<br>v.<br>SNYDER WELL SERVICING, INC.,<br>Respondent. | OSHRC Docket No. 77-1334 |

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

This case arose when the Respondent, Snyder Well Servicing, Inc. ("Snyder"), contested two citations issued by the Secretary of Labor ("the Secretary"). The citations alleged that Snyder had violated the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"), by failing to comply with certain construction safety and health standards in 29 C.F.R. Part 1926. One citation alleged two serious violations of the Act; the other alleged three other than serious violations. Snyder contested all five items. In his complaint, the Secretary amended four of these items to allege, in the alternative, noncompliance with general industry standards in 29 C.F.R. Part 1910.

Administrative Law Judge Harold O. Bullis held a hearing and concluded that the construction standards do not apply to oil well servicing. He applied the alternatively pleaded general industry standards and vacated both serious items and two of the other items. The Secretary petitioned for review of that decision. Commissioner Cottine directed review under section 12(j) of the Act, 29 U.S.C. § 661(i), on the issues raised by the petition, including:

1. Whether the Judge erred in concluding that the construction standards published at 29 C.F.R. Part 1926 are inapplicable to the oil well servicing industry.

2. Whether the Judge erred in vacating Serious Citation No. 1, item 1, because "the Secretary failed to prove the existence of conditions requiring respiratory equipment."

3. Whether the Judge erred in vacating Serious Citation No. 1, item 2 alleging noncompliance with 29 C.F.R. § 1926.251(c)(5).

4. Whether the Judge erred in vacating Citation No. 2, item 1, as amended, alleging noncompliance with 29 C.F.R. § 1926.50(c) or 29 C.F.R. § 1910.151(b) in the alternative.

5. Whether Citation No. 2, item 2, should be amended under Fed. R. Civ. P. 15(b) to allege noncompliance with 29 C.F.R. § 1910.157(a)(1).

I

A

The first issue to be resolved is whether the construction standards in Part 1926 have been shown to applv. We conclude that they have not.

The facts are generally undisputed. Four employees of Snyder were working near Pleasanton, Texas at the site of a newly-drilled oil well owned by Mercury Production Company ("Mercury"). Snyder had been engaged to swab the well. At the time of the inspection the well was not in production and completion operations were being performed.

Swabbing is a process by which materials clogging a well are removed. To accomplish this, a swab on the end of a wire line is dropped into the well bore and then pulled out. The swab has valves which open when it is descending and close when it is pulled upward, catching the materials to be removed above the swab when it is pulled up.

Before Snyder arrived at the site, drilling had been completed and the drilling derrick had been removed from the site. Snyder erected its own "service rig," a telescoping derrick mounted on a mobile base. When the service rig was

brought to the well, the base was blocked, guy wires were used to anchor the rig to the ground, and the derrick was telescoped upwards.

B

In his decision Judge Bullis relied on unreviewed decisions by other administrative law judges which held that the construction standards do not apply to the oil and gas drilling industry. The judge reasoned that if the construction standards do not apply to well drilling they are "clearly . . . not applicable to [the] well servicing industry." He therefore vacated the serious item for which there was no general industry standard alternatively pleaded and considered the remaining four items under the alternatively pleaded general industry standards.

The Secretary argues that the judge erred and that Snyder was engaged in "construction." The Secretary asserts that the drilling of an oil well is not a simple process but includes erecting a derrick, lining the hole with casing, excavating, welding, plumbing and other processes used in construction. The Secretary argues that these activities bring oil well drilling within the definition of construction work. The Secretary further argues that swabbing "is an integral part of the complicated process of constructing an oil well" and is therefore covered by the construction standards, too.

Snyder asserts that whether drilling an oil well may be classified as construction is not the issue because swabbing is completely different from drilling. Snyder claims that swabbing is done whenever the well becomes clogged and that this may occur at any time in the life of an oil well. Snyder argues that, even if drilling is considered to be construction, swabbing is no more part of the construction process than is cleaning the boiler in a factory. The fact that well servicing includes the use of derricks and occurs on temporary worksites does not make it construction work, Snyder asserts, because there are

general industry standards that cover derricks and many of the general industry standards in Part 1910 govern temporary work situations. Snyder also argues that the servicing derricks are not constructed at the well site but are telescoping, mobile units specially mounted on a truck-like chassis. No bolting, welding, or nailing is required to erect them, and they are simply lowered when the work is completed and driven away.

C

The burden of proving the applicability of the cited standards to worksite conditions is on the Secretary. United Geophysical Corp., 81 OSAHRC 77/D6, 9 BNA OSHC 2117, 2121, 1981 CCH OSHD ¶ 25,579, p. 31,906 (No. 78-6265, 1981); Belger Cartage Service, Inc., 79 OSAHRC 16/B14, 7 BNA OSHC 1233, 1235, 1979 CCH OSHD ¶ 24,412, p. 23,440 (No. 76-1480, 1979). We find here that the Secretary has failed to carry that burden. Under 29 C.F.R. §§ 1910.12(a) and (b) the construction standards in Part 1926 apply to "work for construction, alteration, and/or repair, including painting and decorating." We have construed these provisions to mean that Part 1926 applies only to employers who are actually engaged in construction work or who are engaged in operations that are an integral and necessary part of construction work. United Geophysical Corp., 9 BNA OSHC at 2121, 1981 CCH OSHD p. 31,905. We agree with Snyder that swabbing was not shown to be either construction work by itself or to be integrally related to oil well drilling. We therefore need not reach the more general question of whether oil well drilling is construction work.

We are not persuaded by the Secretary's argument that the erection of a derrick brings Snyder's swabbing activities within the definition of construction work. We are unconvinced that Part 1926 was intended to regulate the erection of this derrick. Moreover, that some derricks are governed by standards in Part 1926, 29 C.F.R. §§ 1926.550 and 1926.952(c), is of little weight,

since, as Snyder points out, there are also standards in Part 1910 governing derricks. See 29 C.F.R. § 1910.181.

We are also unconvinced that swabbing is itself construction work or that it is integrally related to oil well drilling. None of the standards in Part 1926 mentions swabbing; and Snyder credibly represents that swabbing may be done years after a well is drilled and has begun production. In this case, well drilling had been completed. That swabbing is performed at a remote, temporary location is significant, but it is not controlling. As Snyder points out, many of the standards in Part 1910 also govern such situations. We therefore conclude that Part 1926 has not been shown to apply here.

II

The judge vacated item 2 of citation 1, which alleged noncompliance with 29 C.F.R. § 1926.251(c)(5). No alternative general industry standard from Part 1910 was pleaded, and Judge Bullis vacated that item. Because we have held that the construction standards do not apply to Snyder's operations, we affirm the judge's vacation of that item. We shall examine the remaining items under the alternatively pleaded standards in Part 1910.

A

Item 1 of the serious citation alleged that Snyder did not have appropriate respiratory protective equipment at the well site for use in emergency situations. The Secretary alleges that Snyder thereby violated 29 C.F.R. §§ 1910.132(a) 2/

---

2/ Section 1910.132(a) provides:

General requirements.

(a) Application. Protective equipment, including personal protective equipment for eyes, face, head, and extremities, protective clothing, respiratory devices, and protective shields and barriers, shall be provided, used, and maintained

(Footnote cont'd)

and 1910.134(a)(2). 3/ It is the Secretary's view that the well was located in a geological area known to produce hydrogen sulfide gas ("$H_2S$"), which is toxic, and that the absence of respiratory equipment could be harmful to Snyder's employees if $H_2S$ were encountered during the swabbing.

The compliance officer who conducted the inspection had 33 years of experience in oil and gas production as an engineer for a major oil company. He had helped develop safety standards for oil well drilling operations, had worked in oil fields with $H_2S$ and had investigated accidents involving it. He testified that some wells in the geological formation where this well was located had been known to produce $H_2S$ and that there were numerous "Dangerous, Poisonous Gas" signs in the area. He testified that there was no $H_2S$ detector at the well site to warn the employees if $H_2S$ were encountered and that, in high concentrations, $H_2S$ can deaden the sense of smell.

---

(Footnote 2 cont'd)

> in a sanitary and reliable condition wherever it is necessary by reason of hazards of processes or environment, chemical hazards, radiological hazards, or mechanical irritants encountered in a manner capable of causing injury or impairment in the function of any part of the body through absorption, inhalation or physical contact.

3/ Section 1910.134(a)(2) provides:

> Respiratory protection.
>
> (a) Permissible practice.
>
> * * *
>
> (2) Respirators shall be provided by the employer when such equipment is necessary to protect the health of the employee. The employer shall provide the respirators which are applicable and suitable for the purpose intended. The employer shall be responsible for the establishment and maintenance of a respiratory protective program which shall include the requirements outlined in paragraph (b) of this section.

The compliance officer predicated his opinion that respiratory protection was necessary on the danger that $H_2S$ would be released by the swabbing. Although he tested for $H_2S$ himself and found only trace amounts, he testified that his failure to find large concentrations of the gas did not mean that there was no $H_2S$ in the well. The compliance officer explained that the pressure caused by material in the bore would hold down $H_2S$ and that the removal of much of this material during swabbing could release $H_2S$. He opined that, because the well was located in an area known to produce $H_2S$, a prudent employer would have protective equipment available.

Mr. Melville, an employee of the Texas Railroad Commission, testified that Mercury had filed an application for a drilling permit with that Commission. In that application, Mercury indicated that it anticipated encountering $H_2S$ in quantities up to 25,000 parts per million. Mr. Melville testified that he personally knew that some wells in the area had produced $H_2S$ in excess of 25,000 parts per million and that such a concentration can be lethal. He expressed the opinion that respiratory protection should be at the site, based on the possibility that $H_2S$ could be encountered in such a concentration.

The safety director for Texas International Company, Snyder's parent company, Mr. Cullifer, testified that before one of his companies will work on a well it requires the owner of the well to determine from drilling records and tests whether protective equipment is necessary. Mr. Cullifer testified that Texas International received a report from Mercury that, in his words, stated that "the amount of hydrogen sulfide gas that they expected to be encountered at this location was nil."

The well had a casing head and a flow line to a holding pit to catch any oil or gas produced. On both there were valves that could be closed if any $H_2S$ were released. Mr. Cullifer testified that, in his opinion, these valves consti-

tuted adequate safety precautions, especially in view of the negative results of the earlier tests.

The compliance officer, on the other hand, testified that the valves were not adequate protection because the flow line could release $H_2S$ into the atmosphere. In order to shut the well down completely, he testified, the swab would have to be removed from the well or cut loose at the well head. He also stated that Snyder's employees could be exposed to the gas while they were putting on new swab rubbers. To perform that task they would have to open fittings at the top of the bore tubing; and gas in the bore could escape there. He also testified that back-up equipment should be available in case a valve was inadvertently opened or failed to shut, or a line failed.

A former employee of Mercury who had worked on the well testified that an $H_2S$ detection device was used during the drilling and never indicated the presence of any $H_2S$. He stated that it was normal procedure to notify the well servicing company if $H_2S$ was detected. Ten days before the inspection, Mercury had circulated gas and oil off the bottom of the well and no $H_2S$ had been found.

B

Judge Bullis vacated this item. He found that the Secretary had not proved that conditions existed requiring respiratory equipment because the evidence did not establish a hazard. He found that if $H_2S$ were encountered the engineering controls provided adequate protection because the valves could be closed. The judge stated that, unlike many safety standards, neither section 1910.132(a) nor section 1910.134(a)(2) presumes a hazard, so the Secretary must prove the existence of a hazard necessitating protective equipment. He found that, although the evidence showed that a hazardous condition might develop during the swabbing, it did not prove that a hazard existed.

The Secretary argues that the judge's conclusion that an actual hazard must be shown is contrary to the intent of both the standards and the Act: to prevent harm from occurring. The Secretary contends that the realistic possibility that a dangerous situation might occur establishes the existence of a potential hazard, triggering the need for protective equipment to be provided. He argues that an employer cannot be allowed to wait until his employees are actually exposed to poisonous gas before he provides protective equipment.

The Secretary further argues that the judge erred in finding that the engineering controls were adequate, because hydrogen sulfide is not likely to be detected in time, and, if it were detected, the valves could probably not be shut in time to prevent harmful exposure to the gas.

Snyder, on the other hand, argues that the valves provided adequate protection because the well could not release the gas directly into the air and the fluid raised by the swab would go directly to the disposal pit 30 to 60 feet from the bore. Snyder argues that the evidence does not prove that it was realistically possible for a hazardous situation to occur, and asserts that it would place an impossible burden on industry to require that protective equipment be provided any time there is any possibility of a hazard occurring, no matter how remote that possibility is.

Snyder argues that section 1910.132(a) does not apply because it sets out general requirements for personal protection, and that respiratory protection is governed by the more specifically applicable section 1910.134. Snyder argues that section 1910.134 must be read as a whole and that such a reading shows that engineering controls are the preferred means of protection. Snyder contends:

> Nowhere does the Standard mention emergency situations or situations in which the engineering controls might fail. This section was intended to cover operations in which employees were exposed to long-term, disease causing effects of air contaminates. By the language of this section, respirators are required only in situations where engineer-

> ing control of the contaminates is not feasible or while these controls are being installed. Neither situation is presented in this case.

Snyder argues that it was not in violation because effective engineering controls were in place on the well and could be operated within a second or two. Snyder also argues that it has no duty to provide respirators unless the Secretary shows exposure to concentrations of air contaminants above the threshold limit value ("TLV") specified for the substance in question. Finally, Snyder argues that its employees were not shown to have been exposed to any hazard and that such a showing is necessary in order to prove a violation of section 1910.134.

C

At the outset, we find that section 1910.134 is more specifically applicable to the facts of this case than is section 1910.132(a). Under section 1910.5(c), therefore, we consider the alleged violation under the more specifically applicable standard. See Granite Groves, A Joint Venture, 77 OSAHRC 28/B12, 5 BNA OSHC 1100, 1977-78 CCH OSHD ¶ 21,594 (No. 10677, 1977). We do not agree with the judge that the item should be vacated in its entirety, however. We reverse the judge and find noncompliance with section 1910.134(a)(2).

We do not agree with Snyder's argument that the duty to provide respirators arises only when the TLV for a dangerous substance is exceeded. If a sudden excursion above the TLV occurs, employees cannot be left unprotected, for section 1910.134(a)(2) requires that respirators be provided "when such equipment is necessary to protect the health of the employee." Moreover, other provisions of section 1910.134 indicate that sudden excursions are to be anticipated and that the standard imposes a duty to take precautions against emergencies even before a TLV is exceeded. See section 1910.134(b)(7) (respirators to be available "for emergency use"); section 1910.134(e)(3) (procedures required for use of respirators in emergencies). To adopt Snyder's argument would mean that no matter how

great the likelihood of an emergency, an employer is not required to take even elementary precautions until it is too late. That would be contrary to the purpose of section 1910.134 and to the preventive purpose of the Act.

Under the circumstances of this case, we find that respirators were necessary in order to protect the health of the employees. Hydrogen sulfide gas may be present but not detected. A large concentration could kill very quickly, and such concentrations had been found in the area. Mercury expected to encounter high levels of $H_2S$. The evidence shows that there was a risk that $H_2S$ would be released by or during the swabbing. If that occurred, it might be too late to send for respirators. The risk of encountering toxic gas at levels above the TLV makes respirators "necessary."

We disagree with the judge's finding that the engineering controls made respirators unnecessary. The $H_2S$ detector on the drilling rig had been removed when that rig was taken away. There was no means on the well site to detect $H_2S$ other than by smelling it. However $H_2S$ deadens the sense of smell, and the employees might therefore have insufficient warning of the presence of $H_2S$. The record shows that the employees must open the well head to change the rubbers on the swab; if $H_2S$ were present, it could then be released. The valve at the bore head is one of the two places where the gas might escape, so an employee trying to close that valve or to cut loose the swab in order to close down the well would have to work very close to the escaping $H_2S$.

We also reject the interpretation of section 1910.134 urged by Snyder, which would require protection only when employees are exposed to disease-causing air contaminants over an extended period of time. Section 1910.134 (a)(1) refers to "air contaminated with harmful . . . gases." $H_2S$ is a harmful gas that can kill in a short time. Although section 1910.134 does state that engineering controls to prevent atmospheric contamination are preferred, it also

requires that respirators be provided "when . . . necessary to protect the health of the employee." To the extent that engineering controls do not afford adequate protection or are not used, respirators must be used. See Todd Shipyards Corp., 81 OSAHRC _____, 9 BNA OSHC 2031, 1981 CCH OSHD ¶ 25,516 (No. 77-2545, 1981).

Accordingly, we find that Snyder's failure to provide this protection to its employees constitutes a violation of section 5(a)(2) of the Act. We also find that the violation was serious within the meaning of section 17(k) of the Act, 29 U.S.C. § 666(i), because death could result if employees who lacked respirators were exposed to $H_2S$.

III

A

Item 1 of citation 2 alleged that Snyder had failed to comply with section 1926.50(c), 4/ or, in the alternative, with section 1910.151(b). 5/ The general

---

4/ Section 1926.50(c) provides:

Medical services and first aid.

* * *

(c) In the absence of an infirmary, clinic, hospital, or physician, that is reasonably accessible in terms of time and distance to the worksite, which is available for the treatment of injured employees, a person who has a valid certificate in first-aid training from the U.S. Bureau of Mines, the American Red Cross, or equivalent training that can be verified by documentary evidence, shall be available at the worksite to render first aid.

5/ Section 1910.151(b) provides:

Medical services and first aid.

* * *

(b) In the absence of an infirmary, clinic, or hospital in near proximity to the workplace which is used for the treatment of all injured employees, a person or persons shall be adequately trained to render first aid. First aid supplies approved by the consulting physician shall be readily available.

industry standard requires that someone on the site be "adequately trained to render first aid" if there is no medical treatment facility "in near proximity to the workplace." The construction standard requires that a person at the site have a certificate in first aid training.

The compliance officer inquired whether anyone on the site had a valid first aid training certificate. He determined that no Snyder employee had a certificate but that an employee of another company at the site had one. That individual left about four hours before Snyder finished work for the day, however. The compliance officer testified that he asked the rig operator, who was in charge of Snyder's crew at the time of the inspection, whether any Snyder employee was trained in first aid; the compliance officer testified that "I got no information that there was." The compliance officer later spoke with the tool pusher, who was the supervisor of Snyder's crew. He had not been present during the inspection. When the compliance officer described the conditions he had found, the tool pusher never indicated that any of Snyder's employees had had first aid training. Instead, he told the compliance officer that Snyder "would get one trained."

B

The judge vacated the citation. He found that the evidence showed that no Snyder employee had the certificate required by the standard in Part 1926, but that did not necessarily prove that no employee was "adequately trained to render first aid," which is all section 1910.151(b) requires.

Snyder argues that the judge was correct, that the compliance officer inquired only about a certificate, not first aid training, and that the Secretary failed to carry his burden of proving that there was no one on the site who had adequate training. The Secretary argues that the compliance officer's testimony is sufficient to establish a violation in the absence of any affirma-

tive evidence that one of the employees had had first aid training. The Secretary would have us draw an adverse inference from Snyder's failure to state that someone at the site had first aid training.

C

We agree with Judge Bullis that the Secretary has failed to carry his burden of demonstrating that nobody on the well site had been adequately trained in first aid. We agree with the judge that a finding that no Snyder employee was trained in first aid would be conjectural. The compliance officer testified that he usually questioned whether a certificated person was at the site, not merely whether an adequately trained person was at the site. While the silence of Snyder's employees is suggestive, it does not sufficiently support the inference that the Secretary would have the Commission draw. Therefore we affirm the judge's disposition.

IV

A

The final item on review is item 2 of citation 2. That item originally alleged noncompliance with 29 C.F.R. § 1926.150(c)(1)(viii). 6/ The complaint amended the citation to add the alternative allegation of noncompliance with

---

6/ Section 1926.150(c)(1)(viii) provides:

> Fire protection.
>
> * * *
>
> (c) Portable firefighting equipment--
> (1) Fire extinguishers and small hose lines.
>
> * * *
>
> (viii) Portable fire extinguishers shall be inspected periodically and maintained in accordance with Maintenance and Use of Portable Fire Extinguishers, NFPA No. 10A-1970.

§§ 1910.157(d)(2) and (3) (1976), 7/ which require inspection of each extinguisher at least monthly and maintenance at least annually. In his petition for review, the Secretary abandoned the alternative section 1910.157(d)(2) and (3) allegations and moved to amend the pleadings under Federal Rule of Civil Procedure 15(b) 8/ to allege noncompliance with section 1910.157(a)(1) (1976). 9/ The issue directed for review was whether the citation should be so amended.

---

7/ These provisions have subsequently been revised and recodified at 29 C.F.R. §§ 1910.157(e) (1981). See 45 Fed. Reg. 60704 (1980).

8/ Rule 15(b) provides:

> Amended and Supplemental Pleadings.
>
> * * *
>
> (b) AMENDMENTS TO CONFORM TO THE EVIDENCE. When issues not raised by the pleadings are tried by express or implied consent of the parties, they shall be treated in all respects as if they had been raised in the pleadings. Such amendment of the pleadings as may be necessary to cause them to conform to the evidence and to raise these issues may be made upon motion of any party at any time, even after judgment; but failure so to amend does not affect the result of the trial of these issues. If evidence is objected to at the trial on the ground that it is not within the issues made by the pleadings, the court may allow the pleadings to be amended and shall do so freely when the presentation of the merits of the action will be subserved thereby and the objecting party fails to satisfy the court that the admission of such evidence would prejudice him in maintaining his action or defense upon the merits. The court may grant a continuance to enable the objecting party to meet such evidence.

9/ This standard has subsequently been revised and recodified at 29 C.F.R. §§ 1910.157(c)(4) (1981). See 45 Fed. Reg. 60704 (1980). The standard in effect when the citation was issued provided:

> Portable fire extinguishers.
>
> (a) General requirements--(1) Operable condition. Portable extinguishers shall be maintained in a fully charged and operable condition, and kept in their designated places at all times when they are not being used.

The compliance officer testified that he observed a fire extinguisher whose safety pin had been pulled. When he investigated, he found that the gauge indicated that the extinguisher was not fully charged. He testified that Snyder's rig operator agreed to get a fully charged extinguisher on his next trip to the office. Mr. Cullifer testified on behalf of Snyder that the company's practice was to have one extinguisher ready for immediate use at all times and that pulling the pin is part of making the extinguisher "ready."

Judge Bullis vacated the citation. He found that the Secretary had not proved a violation of section 1910.157(d) because the Secretary had not established that Snyder did not inspect the extinguisher as required by that standard. From the evidence, the judge said, it was possible that the pin could have been removed and the extinguisher discharged after the extinguisher had had its monthly inspection.

The Secretary asserts that the evidence establishes that Snyder failed to maintain the extinguisher in a fully charged and operable condition as required by section 1910.157(a)(1). Snyder does not address the issue directed for review, whether the citation should be amended to allege noncompliance with section 1910.157(a)(1). Snyder instead argues that the judge correctly found that the Secretary had failed to prove a violation of section 1910.157(d).

B

Chairman Rowland votes to vacate this item. He would deny the motion to amend for the reasons stated in his separate opinion.

Commissioner Cleary also votes to vacate this item, but his reasons are different from Chairman Rowland's. In Mr. Cleary's view, even if the motion to

amend is granted, a violation has not been proven. The standard requires that portable fire extinguishers be maintained in a fully charged condition. Under Schundler Co., 78 OSAHRC 9/E14, 6 BNA OSHC 1343, 1978 CCH OSHD ¶ 22,508 (No. 15548, 1978), our inquiry is whether the employer's maintenance of the extinguishers was adequate. Mr. Cleary finds insufficient evidence that Snyder's maintenance efforts were deficient. He therefore votes to vacate this item. Accordingly, item 2 of citation 2 is vacated.

Commissioner Cottine would permit the amendment and find a violation. Accordingly, he dissents from the disposition of this item. Commissioner Cottine notes that: (1) the parties have tried all material facts; (2) Snyder makes no claim of prejudice; and (3) Snyder has not objected to the amendment even though the issue was specifically directed for review. Accordingly, the amendment is proper. See Mississippi Power & Light Co., 79 OSAHRC 109/D12, 7 BNA OSHC 2036, 1980 CCH OSHD ¶ 24,146 (No. 76-2044, 1979) and cases cited. Commissioner Cottine concludes that the Secretary has established a prima facie violation of section 1910.157(a)(1). The evidence establishes that the gauge showed less than a full charge. In the absence of evidence to the contrary, this is sufficient to establish that the extinguisher was not fully charged. Cf. Alpha Poster Service, Inc., 76 OSAHRC 141/B8, 4 BNA OSHC 1883, 1976-77 CCH OSHD ¶ 21,354 (No. 7869, 1976)(label on a container is presumed to identify contents accurately). Snyder has neither rebutted the Secretary's showing nor introduced any evidence to support its conjectural argument that the gauge might have been defective.

Furthermore, the term "maintained" in section 1910.157(a)(1) requires that portable fire extinguishers be continuously kept or preserved in a fully charged and operable condition. The term does not refer to an affirmative act of maintenance. The duty to perform maintenance on fire extinguishers is imposed by section 1910.157(d)(3) (recodified at 29 C.F.R. § 1910.157(e)(3), see note 7 supra) and is separate and distinct from the duties imposed by section 1910.157 (a)(1). Accordingly, Commissioner Cottine would overrule the erroneous interpretation of section 1910.157(a)(1) in Schundler Co., supra, and affirm the citation.

V

The Secretary proposed a penalty of $240 for the respirator violation. The compliance officer testified that Snyder employs about 150 people in all, that Snyder had an "average" safety program, that Snyder had no record of prior violations, and that Snyder officials were cooperative during the inspection. Snyder's safety program was described in detail by Mr. Cullifer and was evidenced by an exhibit Snyder introduced. We find the penalty proposed by the Secretary to be appropriate.

Accordingly, we affirm a serious violation of the Act for failure to comply with section 1910.134(a)(2) and assess a penalty of $240.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: FEB 26 1982

ROWLAND, Chairman, concurring in part and dissenting in part:

I concur in the majority's determination in Part I of the lead opinion that swabbing has not been shown to be "construction work," and in its disposition of the first aid item in Part III. While I join in the finding in Part II of the lead opinion that section 1910.134(a)(2) is more specifically applicable to the respirator item than section 1910.132(a), I dissent from the affirmance of the item. Finally, I concur with Commissioner Cleary only in the disposition of the fire extinguisher item; I would not reach the question of whether Snyder complied with section 1910.157(a)(1) because I would deny the Secretary's motion to amend to that standard.

I

Section 1910.134(a)(2) states that respirators are to be provided "when such equipment is necessary to protect the health of the employee." The majority finds that the Secretary has shown that respirators were "necessary" within the meaning of this standard. I disagree for the reasons that follow.

Section 1910.134(a)(2) provides no guidance to employers as to when a respirator "is necessary." Because the phrase "when such equipment is necessary to protect the health of the employee" in section 1910.134(a)(2) is no more specific than the similar phrase "whenever it is necessary by reason of hazards" in section 1910.132(a), I would require the Secretary to make the same showing under section 1910.134(a)(2) of when protection is "necessary" that he must make under section 1910.132(a). Under section 1910.132(a), the Commission's test of whether protection is "necessary" is "whether a reasonable person familiar with the circumstances surrounding an allegedly hazardous condition, including any facts unique to a particular industry, would recognize a hazard warranting the use of protective equipment." Owens-Corning Fiberglas Corp., 79 OSAHRC 26/D6, 7 BNA

OSHC 1291, 1295, 1979 CCH OSHD ¶ 23,509, p. 28,491 (No. 76-4990, 1979), aff'd on other grounds, 659 F.2d 1285 (5th Cir. 1981). This has not been shown here. 10/

Section 1910.134(a)(2) states that a respirator be provided only when it "is necessary" to protect an employee. At the time the alleged violation occurred, there were not excessive levels of hydrogen sulfide gas. While I share the majority's concern that employees be protected in advance of actual exposure to a hazardous concentration of a toxic substance, more substantial proof than a vague "risk" of excessive exposure is required to impose this obligation on an employer. A violation of section 1910.134(a)(2) cannot be premised solely upon unsubstantiated speculation that exposure to excessive levels of toxic gas was possible.

The majority makes no finding that a reasonable person familiar with the circumstances would have recognized that Snyder's employees were exposed to a hazard warranting the provision of respirators. Indeed, the record would not support such a finding. Although both the compliance officer and Mr. Melville both gave their opinions that it would have been prudent under the circumstances to have respirators available, these merely personal views are unsupported by the evidence.

---

10/ The court of appeals decision in Owens-Corning held that to show that a reasonable person would have recognized the presence of a hazard making the use of protection necessary, the Secretary must show either that it is the custom and practice in the industry to provide protective equipment or that the employer has actual knowledge that the condition was hazardous. 659 F.2d at 1288. Assuming I were to apply the court's test for determining whether a hazard exists in this case, there is no evidence here that it is the practice of the well servicing industry to provide respirators at wells during the swabbing process where no significant amount of $H_2S$ has been encountered during drilling, nor does the record show that Snyder had either actual knowledge or reason to believe that there was $H_2S$ in the well in sufficient quantity to be dangerous. Indeed, the compliance officer agreed that the valves on the well were the type customarily used. However, inasmuch as I find that the Secretary failed to make the showing required by the Commission's Owens-Corning test, it is not necessary to consider here whether the Commission's test is correct.

Mr. Melville could testify only that the well owner filed a report for the field in which the well was located that showed that $H_2S$ may be encountered in concentrations of 25,300 parts per million in a cubic foot of gas, that this expectation was founded upon concentrations noted in two other producing wells in the field, and that the amount of $H_2S$ would normally be consistent throughout the field. Mr. Melville acknowledged, however, that some wells and some formations in the area do not emit $H_2S$ gas.

The Secretary's failure to establish the significance of the word "field" as used by Mr. Melville is crucial. For example, there is no evidence in the record to suggest that all wells drilled in this "field" were drilled into the same formations or to the same or similar depth. Yet, Mr. Melville acknowledged that whether respiratory protection was necessary depends on the depth of the drilling and varies with the formation the well is drilled into. Mr. Melville's testimony is further clouded by his frequent use of the inexact term "area," which he acknowledged to refer only to surface areas, rather than geological formations. In short, I cannot say from Mr. Melville's testimony that the actual conditions at this well were reliably correlated with those of other wells known to present $H_2S$ hazards.

The compliance officer conjectured that swabbing "could release any $H_2S$ in the well," but he merely assumed that there was a dangerous amount of $H_2S$ in the well. In fact, there is no evidence that there was ever more than a trace of $H_2S$ in the well. Thus, not only does the compliance officer's testimony fail to show that the well here could produce significant amounts of $H_2S$, Snyder also was specifically informed by the driller that no hazardous concentration of gas existed. There is no evidence that $H_2S$ had been encountered in the well during the drilling or during the circulation of oil and gas from the bottom of the well. Snyder came onto the site after drilling had been completed and the well

had been tested by Mercury Production, and Mercury Production had informed Snyder that the amount of $H_2S$ encountered would be nil. This information was consistent with the compliance officer's own tests of the well, which revealed only a trace amount of $H_2S$; indeed, he acknowledged that the well had shown unusually low amounts of the gas. His opinion that the well could nevertheless produce lethal amounts of $H_2S$ was based upon information that the well had been drilled into the buda geological formation, and that it was his "understanding" that the entire buda formation contained $H_2S$; yet he acknowledged that he did not have enough information to say whether some wells in the buda formation were sour and some were not. The compliance officer speculated that $H_2S$ gas could migrate from other areas and formations containing the gas, but he did not establish that such migration occurred in the specific area of this well. In fact, the compliance officer's information on this matter came entirely from general information from the Texas Railroad Commission and literature on the matter. The compliance officer's mere opinion that a dangerous quantity of gas could be released, unsupported by any specific evidence, is not a sufficient basis on which to find a violation. Air-Kare, 81 OSAHRC 98/A2, 10 BNA OSHC 1146, 1150, 1981 CCH OSHD ¶ 25,758, p. 32,178 (No. 77-1133, 1981)(dissenting opinion).

Finally, there is no other evidence to indicate that a reasonable person familiar with the circumstances would not have considered the trace amounts detected here to be representative of conditions likely to be encountered during swabbing. While the compliance officer stated that Snyder through the swabbing operation would be gradually reducing the pressure on the well, he never specified what pressure would ultimately be achieved, nor did he correlate any particular well pressure with the potential amount of $H_2S$ rising to the surface. Although the drilling log showed various pressures in the well after the inspection, the compliance officer never testified that $H_2S$ gas would be likely to be released at any of these pressures.

I therefore cannot say, on this record, that a reasonable employer would have recognized a hazard warranting the use of respirators, particularly where, as here, Snyder had been informed by Mercury Production that $H_2S$ would not be encountered in dangerous quantities. In the absence of such evidence, this citation should be vacated.

II

With respect to the fire extinguisher item, I would deny the Secretary's motion to amend the pleadings under Federal Rule of Civil Procedure 15(b) to allege noncompliance with section 1910.157(a)(1). I do not believe the parties understood at the hearing that they were trying the issues raised by that standard. A litigant has the right to fair notice of the issues to be tried, so that he can adequately prepare and present his case. Pleadings may therefore be amended under Rule 15(b) only when the parties recognize that they are trying unpleaded issues. "[I]t cannot be fairly said that there is any implied consent to try an issue where the parties do not squarely recognize it as an issue in the trial." 3 Moore's Federal Practice ¶ 15.13[2] at 992 (2d ed. 1974), quoted in Usery v. Marquette Cement Manufacturing Co., 568 F.2d 902, 907 (2d Cir. 1977). See Vicon Corp., 81 OSAHRC 98/C4, 10 BNA 1153, 1158, 1981 CCH OSHD ¶ 25,749, p. 32,160 (No. 78-2923, 1981) (concurring opinion), appeal filed, No. 81-2359 (8th Cir. December 10, 1981).

In my view, Snyder did not consent to trial of the issues raised by section 1910.157(a)(1). Both the citation and complaint alleged that Snyder had violated standards imposing requirements for the inspection and maintenance of fire extinguishers in that a particular extinguisher was not fully charged. While the parties clearly litigated the actual condition in terms of readiness for operation of the one extinguisher in question, they did so on the understanding that this evidence was relevant to Snyder's overall inspection and maintenance

program. In my opinion, Snyder cannot be said to have squarely recognized that the condition of this extinguisher was in issue as a separate and distinct ground for finding a violation. Indeed, had Snyder been aware at the hearing that a violation could be found based on the condition of the extinguisher apart from the nature and adequacy of the overall inspection program, it might very well have sought to limit the purpose for which the evidence could be used.

However, in my view it is unrealistic and unfair to expect an employer to anticipate every unpleaded charge which the Secretary might subsequently attempt to inject into the case. It is equally unfair to require the employer to attempt to limit the purpose for which evidence is adduced in order to avoid the implication of consent to try issues raised after the close of the hearing. Since it is the Secretary's theory on review that Snyder is in violation of section 1910.157(a)(1) solely on the basis of the actual condition of one particular extinguisher, whereas Snyder could not have understood that it was litigating the issue of a violation on that ground, the requested amendment is improper. Since the Secretary has abandoned the original allegation appearing in the complaint, I agree with Commissioner Cleary that this item of the citation must be vacated.

Appearances: U. Sidney Cornelius, Jr.
Dallas, Texas

Attorney for the Complainant

George R. Carlton, Jr.
Fort Worth, Texas

Attorney for the Respondent

DECISION AND ORDER

BULLIS, Judge:

Snyder Well Servicing, Inc. (Snyder) was charged with two serious violations and three nonserious violations of the Occupational Safety and Health Act of 1970, (29 U.S.C. §651 et seq. (the Act). The alleged violations resulted from an inspection conducted by the Occupational Safety and Health Administration (OSHA) on March 30th and April 1st, 1977, at a newly drilled well of Mercury Production Co. located 11 miles east of Pleasanton, Texas. Snyder was

engaged in swabbing operations to complete the well.

The first serious violation alleged that Snyder violated the Act by not having appropriate respiratory protection devices available while conducting swabbing operations in a formation which could have sour hydrocarbons containing toxic hydrogen sulfide gas. The citation charged a failure to comply with 29 CFR 1926.103(a)(1), a construction standard. The subsequent Complaint amended the citation to allege in the alternative a failure to comply with 29 CFR 1910.132(a) or 1910.134(a)(2), general industry standards.[1]

---

[1] 29 CFR 1926.103(a)(1) reads: "In emergencies, or when controls required by Subpart D of this part either fail or are inadequate to prevent harmful exposure to employees, appropriate respiratory protective devices shall be provided by the employer and shall be used."

29 CFR 1910.132(a) reads: "Application. Protective equipment, including personal protective equipment for eyes, face, head, and extremities, protective clothing, respiratory devices, and protective shields and barriers, shall be provided, used, and maintained in a sanitary and reliable condition wherever it is necessary by reason of hazards, or mechanical irritants encountered in a manner capable of causing injury or impairment in the function of any party of the body through absorption, inhalation or physical contact."

29 CFR 1910.134(a)(2) reads: "Respirators shall be provided by the employer when such equipment is necessary to protect the health of the employee. The employer shall provide the respirators which are applicable and suitable for the purpose intended. The employer shall be responsible for the establishment and maintenance of a respiratory protective program which shall include the requirements outlined in paragraph (b) of this section."

The second serious violation alleged that there was only one wire line clip on each of the four guy lines on Snyder's derrick, instead of the number required by 29 CFR 1926.251(c)(5).[2] No alternative general industry standard was cited in the Complaint for this violation.

The three other or nonserious violations charged in Citation No. 2 alleged a failure to comply with 29 CFR 1926.50(c) by not having a person with a valid first-aid certificate at the worksite; a failure to inspect and maintain a portable fire extinguisher as required by 29 CFR 1926.150(c)(1)(viii); and a failure to use an approved metal safety can for storing gasoline as required by 29 CFR 1926.152(a)(1). In his Complaint the Secretary alleged alternative general industry standards for each of the nonserious violations, 29 CFR 1910.151(b) for the first violation, 1910.157(d)(2) or 29 CFR 1910.157(d)(3) for the second violation, and 29 CFR 1910.106(d)(2) for the third violation.[3]

---

[2] 29 CFR 1926.251(c)(5) reads: "When U-bolt wire rope clips are used to form eyes, Table H-20 shall be used to determine the number and spacing of clips."

[3] 29 CFR 1926.50(c) reads: "In the absence of an infirmary, clinic, hospital, or physician, that is reasonably accessible in terms of time and distance to the worksite, which is available for the treatment of injured employees, a person who has a valid certificate in first-aid training from the U.S. Bureau of Mines, the American Red Cross, or equivalent training that can be verified by documentary evidence, shall be available at the worksite to render first-aid."

[Footnote continued on following page]

[Footnote continued from preceding page]

---

3

29 CFR 1910.151(b) reads: "In the absence of an infirmary, clinic, or hospital in near proximity to the workplace which is used for the treatment of all injured employees, a person or persons shall be adequately trained to render first aid. First aid supplies approved by the consulting physician shall be readily available."

29 CFR 1926.150(c)(1)(viii) reads: "Portable fire extinguishers shall be inspected periodically and maintained in accordance with Maintenance and Use of Portable Fire Extinguishers, NFPA No. 10A-1970."

29 CFR 1910.157(d)(2) reads: "(i) Extinguishers shall be inspected monthly, or at more frequent intervals when circumstances require, to insure they are in their designated places, to insure they have not been actuated or tampered with, and to detect any obvious physical damage, corrosion, or other impariments. (ii) Any extinguishers showing defects shall be given a complete maintenance check."

29 CFR 1910.157(d)(3) reads: "(i) At regular intervals, not more than 1 year apart, or when specifically indicated by an inspection, extinguishers shall be thoroughly examined and/or recharged or repaired to insure operability and safety; or replaced as needed. (ii) Extinguishers removed from the premises to be recharged shall be replaced by spare extinguishers during the period they are gone. (iii) Pails or drums of powder-extinguishing agents for scoop or shovel application to metal fires shall be kept full at all times. (iv) Each extinguisher shall have a durable tag securely attached to show the maintenance or recharge date and the initials or signature of the person who performs this service."

29 CFR 1926.152(a)(1) reads: "Only approved containers and portable tanks shall be used for storage and handling of flammable and combustible liquids. Approved metal safety cans shall be used for the handling and use of flammable liquids in quantities greater than one gallon, except that this shall not apply to those flammable liquid materials which are highly viscid (extremely hard to pour), which may be used and handled in original shipping containers. For quantities of one gallon or less, only the original container or approved metal safety cans shall be used for storage, use, and handling of flammable liquids."

[Footnote continued on following page]

In its Answer Snyder admitted jurisdiction. It denied, however, the existence of each of the violations charged and alleged that the construction standards cited by the Secretary do not apply to the oilwell servicing industry.

The matter was heard in San Antonio, Texas, on December 20, 1977. Both parties have filed post-hearing briefs.

There was no basic dispute in the evidence. The inspection was conducted by Roger Frazier, a compliance officer with OSHA. The area where the well was located was known to be an area that produced sour gas or hydrogen sulfide.

---

[Footnote continued from preceding page]

3 29 CFR 1910.106(d)(2) reads: "(i) General. Only approved containers and portable tanks shall be used. Metal containers and portable tanks meeting the requirements of and containing products authorized by Chapter I, Title 49 of the Code of Federal Regulations (regulations issued by the Hazardous materials Regulations Board, Department of Transportation), shall be deemed to be acceptable. (ii) Emergency venting. Each portable tank shall be provided with one or more devices installed in the top with sufficient emergency venting capacity to limit internal pressure under fire exposure conditions to 10 p.s.i.g., or 30 percent of the bursting pressure of the tank, whichever is greater. The total venting capacity shall be not less than that specified in paragraphs (b)(2)(v)(c) or (e) of this section. At least one pressure-actuated vent having a minimum capacity of 6,000 cubic feet of free air (14.7 p.s.i.a. and 60° F) shall be used. It shall be set to open at not less than 4 p.s.i.g. If fusible vents are used, they shall be actuated by elements that operate at a temperature not exceeding 300° F."

There were numerous signs in the area warning of the presence of dangerous gases (Tr.10). During his walk-around inspection Frazier observed that Snyder had no respiratory protective equipment available for use by its employees in the event they encountered hydrogen sulfide. His position was that since hydrogen sulfide is extremely toxic and in concentrated quantities will kill almost immediately, the absence of protective equipment presented a hazardous situation to the four employees of Snyder who were present (Tr.10,36). While the tests he conducted showed only a trace of hydrogen sulfide, he stated that in high concentrations it deadens a person's sense of smell and is lethal in a very short period of time (Tr.10,37). He also testified that in the field where the well in question was located the Edwards formation was known to be sour and produce hydrogen sulfide (Tr.41,42). The Buda formation, the formation in which Snyder was swabbing the instant well, is shallower than the Edwards formation and while some wells in that formation had produced hydrogen sulfide, some nad not (Tr.17,42).

Before Snyder commenced its swabbing operations Dow Chemical Co. had acidized the well by pumping in hydrochloric acid. In conducting the swabbing operation a swab or pump was lowered into the well on the end of a wire line. The well was equipped with a casing head while these operations were performed and also had a flow line either 30 or 60 feet long to a pit into which any production of gas

or oil would flow while the well was being swabbed (Tr.90). Any flow of oil or gas could be cut off by valves at the casing head or on the flow line.

Mike Cullifer, corporate safety director for Texas International Company, the parent company of Snyder, testified concerning the safety program initiated by his company for all of its subsidiaries. Its "1977 accident prevention plan of action" was introduced as Exhibit R-2 and contains five pages dealing with hydrogen sulfide. Texas International has two hydrogen sulfide trailers fully equipped with fresh air masks and hoses for use at well sites where hydrogen sulfide is expected (Tr.78). In making a determination where these trailers are to be used, Texas International relies on information obtained from the drilling company. Cullifer testified that Texas International requires a producer to furnish information as to whether the well is in a hydrogen sulfide zone and whether a trailer is needed (Tr.80,81). Here, Mercury Production, Inc., the driller, advised that they did not expect to encounter hydrogen sulfide (Tr.81,85). Exhibit R-4 is a letter from Mercury, written December 14, 1977, affirming that a sour gas sniffer was in operation during the drilling of the well in question and gave no indication of sour gas. Cullifer further stated that his company will not swab or work on a well which does not have a well head and a flow line with engineering controls to shut down the well (Tr.80).

The compliance officer was not aware at the time of his inspection that the well had been tested for hydrogen sulfide by Mercury Production Co. That fact did not become known to him until after Snyder had contested the citation (Tr. 40,41). He testified, however, that the fact no hydrogen sulfide is encountered during the drilling operation does not mean that it won't be encountered during the swabbing operations (Tr.62,63).

Tom R. Melville, a field staff engineer with the Texas Railroad Commission, testified that he was familiar with the field in which the well in question was located and that some wells in the area produced hydrogen sulfide in excess of 25,000 parts per million (Tr.16). He stated that the Railroad Commission requires the driller to report any hydrogen sulfide encountered (Tr.19). Prior to drilling Mercury Production filed a report stating they expected to encounter hydrogen sulfide in excess of 25,000 parts per million. Nothing, however, was filed after production was commenced (Tr.20,21). Melville expressed the opinion that in a situation where 25,000 parts per million of hydrogen sulfide is expected respiratory equipment should be available (Tr.23). He also stated, however, that if the well were tested and found free of hydrogen sulfide, no equipment would be necessary (Tr.24).

During his inspection the compliance officer also noted that each of the four guy wires on Snyder's derrick were

fastened with but one wire clip rather than the minimun number of three or four each as required by the cited standard (Tr.25,26). Exhibits C-1 and C-2 depict two of the guy wires with but one clip each. The compliance officer viewed the violation as serious, stating that if the derrick should fall because of the lack of support from the guy wires it could be fatal to Snyder's employees (Tr.26).

With regard to the three nonserious violations alleged Frazier stated that during his walk-around he inquired if anyone at the location was trained in first aid with a valid certificate. He was advised that there was no one present after 2 p.m. when the Dow Chemical people left the scene (Tr.28). The nearest hospital or clinic was 11 or 12 miles away (Tr.28). Frazier also noted a fire extinguisher, shown in Exhibit C-3, with the pressure down on the guage and the safety pin pulled (Tr.29,30). In addition he noted a five-gallon can containing gasoline in Snyder's pickup truck. He determined that the gasoline in this can was used as a reserve supply when trips were made to remote locations (Tr.32). The can was not approved for the storage of gasoline, having no flame arrestor and no automatic or self-closing valve (Tr.33). On cross-examination he stated that he couldn't remember, when inquiring about first aid training, whether he asked for a certificate. He stated, however, that that was the usual inquiry he made (Tr. 50). In addition

he stated that he did not examine the inspection record on the fire extinguisher (Tr.59).

The citations issued charged violations of the Act for failure to comply with specific construction standards. The Complaint, in addition to alleging noncompliance with the construction standards, alleged similar general industry standards for each of the violations except the second serious violation dealing with the number of clips on the guy wires.

The Review Commission has not spoken on the applicability of construction standards to the oil and gas drilling industry or to those companies involved in servicing oil and gas wells.[4] Several Review Commission Judges, however have held that the general industry standards, not construction standards, are applicable to the oil and gas drilling industry. Ard Drilling Co., Inc. and Bahaney Drilling Co., Inc. 77 OSAHRC 109/B14, BNA 5 OSHC 1086, CCH 1976-77 OSHD ¶21,021 (Nos. 15854 and 15969, 1976),

---

4 In a recent Review Commission decision, Secretary v. T.J. Service Co., BNA 6 OSHC 1509 (No. 14,991, March 17, 1978) violations of the Act for failure to comply with construction standards by an oil well servicing company was affirmed. However, the applicability of construction standards to the industry was not specifically addressed and presumably was not raised.

Fairbanks Well Service, Inc., 77 OSAHRC 134/D14, BNA 5 OSHC 1873, CCH 1977-78 ¶21,740 (No. 76-4297, 1977), MMD Drilling Corp., 77 OSAHRC 183/C5 BNA 5 OSHC 2083, CCH 1977-78 OSHD ¶22,289, (No.76-4149, 1977). The reasoning of Judge Burchmore in Ard and Bahaney appears sound and is adopted here. If the construction standards are not applicable to the oil drilling industry, clearly they are not applicable to well servicing industry. Therefore the general industry standards alleged by the Secretary will be applied.

The second serious violation alleged must therefore be vacated. No alternative general industry standard was alleged. Even if construction standards could be applied, it is questionable that the cited standard would fit the instant case. While the number of wire clips on the guy wires clearly did not meet the number required by 29 CFR 1926.251(c)(5), that standard pertains specifically to "rigging equipment for material handling." In Atlas Steel Erectors Co., Inc., 76 OSAHRC 11/D7, BNA 3 OSHC 1998, CCH 1975-76 OSHD ¶20,408, (No. 12577, 1975) a violation charged under that standard was dismissed where the equipment dealt with transporting personnel.

The first alleged serious violation must also be vacated. The Secretary failed to prove the violation alleged.

Neither the construction standard at 29 CFR 1926.103(a)(1) nor the two general industry standards, 29 CFR 1926.132(a)

and 29 CFR 1910.134(a)(2), unlike many of the safety standards promulgated, presume the existence of a hazard. The cited construction standard, even if applicable, requires respiratory equipment "in emergencies, or when controls required by subpart D of this part either fail or are inadequate to prevent harmful exposure to employees." The two general industry standards require respirators "when such equipment is necessary to protect the health of the employee", and protective equipment "wherever it is necessary by reason of hazards of processes or environment."

Here the Secretary failed to prove the existence of conditions requiring respiratory equipment. The evidence presented did not show the existence of a hazard. It showed only that a hazardous condition might develop during swabbing operations. But even if the highly toxic hydrogen sulfide were encountered during swabbing operations, engineering controls on the well provided adequate safeguards to protect Snyder's employees.

The drilling of the well had been completed and no hydrogen sulfide had been encountered. While this, according to the evidence, did not necessarily mean that hydrogen sulfide would not be produced when the well was swabbed for completion purposes, the well had been equipped with two valves that could shut down the well. One was on the casing head and the other was on the flow line from

which any oil or gas produced would exit into a pit some 30 or 60 feet distant. The presence of those engineering controls to shut off any flow of hydrogen sulfide that might have occurred was adequate to protect Snyder's employees.

The first two nonserious violations alleged in Citation No. 2 will also be vacated. While the evidence was sufficient to prove violations of the cited construction standards, it was not sufficient to sustain violations of the alternative general industry standards.

The significant difference between the construction standard and general industry standard requiring the availability of a person trained in first aid is that the construction standard also specifies that the person so trained have a valid certificate in first aid training. Here the compliance officer inquired if a person "trained in first aid with a valid certificate was on the job." No such person was available. Such evidence. however, does not necessarily prove that none of Snyder's employees present were trained in first aid. It proves only that none of them had a valid certificate. While it is likely that none of them were trained in first aid, such a finding would be conjectural. The alleged violation must, therefore, be vacated.

The construction standard cited dealing with portable

fire extinguishers requires that they be "inspected periodically and maintained." The general industry standards cited in the alternative require monthly inspection and recharging and repair if the inspection indicates the need. Here the compliance officer's testimony was only that his observation of the fire extinguisher indicated that the pin had been pulled and the pressure was down. He made no inquiry as to the inspection record of the fire extinguisher in question. While such evidence might prove a failure to maintain the fire extinguisher as required by the construction standard, it does not prove that Snyder failed to conduct the inspections required by the general industry standards or take the necessary steps to recharge or repair the extinguisher indicated by such inspections. The need for recharging could well have occurred after the latest inspection made in conformity with the standards.

The third nonserious violation will be affirmed. The essence of the compliance officer's testimony with regard to the five gallon gasoline can in the bed of Snyder's pickup was that it was not an approved container and that it contained gasoline and was used to haul gas to remote locations. His testimony was not contradicted and is sufficient to establish a violation of either the construction standard cited or the general industry standard.

No penalty was proposed for this violation and no need for the assessment of a penalty is indicated by the evidence. The gravity of the violation is low, Snyder was cooperative during the inspection and had no history of previous violations.

From the entire record the following Findings of Fact and Conclusions of Law are made.

## FINDINGS OF FACT

1. Snyder is an employer with employees engaged in a business affecting interstate commerce within the meaning of the Act.
2. On or about March 30, 1977, Snyder was engaged in swabbing an oil well for Mercury Production Co.
3. During its swabbing operations, Snyder did not have respiratory protective equipment available for its employees. The oil well was equipped, however, with adequate engineering controls to protect Snyder's employees from any hazard that may have been encountered from poisonous gases.
4. The four guy wires on Snyder's derrick were secured with but one wire clip each.
5. No person with a valid certificate in first aid training was present at Snyder's worksite

after 2 P.m. on March 30, 1977. The evidence did not prove that no person not trained in first aid was present.

6. A portable fire extinguisher with the pressure down and the safety pin pulled was present at Snyder's worksite on March 30, 1977. The evidence did not prove the fire extinguisher had not been inspected monthly or that such inspections indicated a need for recharging or repair.

7. A five gallon gasoline can in the bed of Snyder's pickup at its worksite on March 30, 1977, was not an approved container for gasoline and was not equipped with a flame arrestor or automatic or self-closing valve.

8. No penalty for the above violation is indicated.

## CONCLUSIONS OF LAW

1. The Review Commission has jurisdiction of the parties and subject matter of these proceedings.

2. Construction standards are not applicable to the oil and gas drilling industry or to the well servicing industry.

3. Snyder was not in violation of the Act for failing to comply with 29 CFR 1926.103(a)(1), 29 CFR 1910.132(a) or 29 CFR 1910.134(a)(2) on March 30, 1977.

4. Snyder was not in violation of the Act for failing to comply with 29 CFR 1926.251(c)(5) on March 30, 1977.

5. Snyder was not in violation of the Act for failing to comply with 29 CFR 1926.50(c) or 29 CFR 1910.151(e) on March 30, 1977.

6. Snyder was not in violation of the Act for failing to comply with 29 CFR 1926.150 (c)(i)(viii), 29 CFR 1910.157(d)(2) or 29 CFR 1910.157(d)(3) on March 30, 1977.

7. Snyder was in violation of the Act for failing to comply with 29 CFR 1910.106(d)(2) on March 30, 1977.

From the foregoing Findings of Fact and Conclusions of Law is is ORDERED:

1. Items 1 and 2 of Citation No. 1 alleging serious violations of the Act are vacated.

2. Items 1 and 2 of Citation No. 2 alleging nonserious violations of the Act are vacated.

3. Item 3 of Citation No. 2 is affirmed as a nonserious violation of the Act. No penalty is assessed.

HAROLD O. BULLIS
Administrative Law Judge

| CARGILL, INC., NUTRENA FEED DIV., | : | |
| Respondent. | : | |
| | : | |

DECISION

Before ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

A decision of Administrative Law Judge Alan M. Wienman is before us for review pursuant to section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). Cargill, Inc., Nutrena Feed Division ("Cargill") was charged with two violations of section 5(a)(1) of the Act, 29 U.S.C. § 654(a)(1),[1/] the "general duty clause." Judge Wienman vacated both items on the ground that the Secretary of Labor had failed to carry his burden of proof. Commissioner Cottine granted the Secretary's petition for review and directed review of two issues:

---

1/ Section 5(a)(1), 29 U.S.C. § 654(a)(1), provides:

> Sec. 5(a) Each employer —
>
> (1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees.

1. Whether the ALJ erred in vacating the alleged violation of § 5(a)(1) on the grounds that the Secretary had failed to prove the existence of a recognized hazard and feasible means of abatement.

2. Whether the ALJ erred in vacating item 3(c) of the citation, alleging a violation of § 5(a)(1), on the ground that NFPA Standards "are not acceptable proof of industry recognition of a hazard."

For the reasons that follow we affirm the judge's decision as to one item and reverse and remand as to the other.

I

Cargill operates a grain elevator and feed mill where grain and commodities are processed into animal feed. The elevator was built in 1959, the feed mill in 1965, and both were acquired by Cargill in 1967. Both the grain elevator and the feed mill contain vertical conveyors called "legs," which consist of flexible belts equipped with buckets that pull grain and other materials from one level to another. The belts are enclosed in shafts composed partly of sheet metal and partly of concrete.

Grain and commodities are delivered to Cargill by truck and train and off-loaded into receiving pits which are covered by steel grates. The grates over the grain pits form openings of about two inches by twelve inches, and the grates over the commodity pits form openings of about two-and-one-half inches by nine inches. The grain and commodities are transported from the pits by screw conveyors which have a tolerance of about three-eighths of an inch.

In November 1978 this facility was cited for several violations of the Act, including the two items at issue here, item 3(b) and item 3(c). The gravamen of item 3(b) is that those legs which were used by Cargill to transport grain present hazards of secondary grain dust fire

and explosion because the legs are not equipped with explosion relief venting. As the Secretary explained at the hearing, the presence of explosion relief venting in the cited legs would not prevent a grain dust fire or explosion in the first instance, but it would prevent secondary fires and explosions. Secondary grain dust fires and explosions occur when an initial dust explosion in a confined space creates pressure waves which raise additional dust into suspension, leading to a series of explosions of increasing intensity. As a means of abatement, the Secretary suggested that Cargill extend the sheet metal casings at the top of the legs directly up through the roofs of the two buildings so that in the event of a grain dust explosion, the resulting pressure waves could move up and out of the leg without causing secondary explosions and fires.

Item 3(c) alleged that Cargill's receiving pits should have been equipped with permanent magnets, approved electromagnets, or specific gravity separators or screens capable of preventing entry of tramp metal into the processing system. "Tramp metal" is ferrous material which accidentally gets mixed in with the grain and commodities as they are transported from the farm to various processors. The gravamen of this charge is that the tramp metal can, as a result of frictional contact with Cargill's metal processing machinery, give off sparks. The Secretary alleges that these sparks could provide the ignition source for grain dust fires or explosions.

Judge Wienman vacated both items on the ground that the Secretary had failed to prove the existence of a recognized hazard or a feasible means of abatement. He also ruled that the National Fire Protection Association Standard 61B ("NFPA 61B"), "Grain Elevators Bulk Handling

Facilities," is not "acceptable proof" of industry recognition of a hazard.

II

The first question to be resolved with respect to item 3(b), "failure to provide explosion relief venting in grain transport legs," is whether the judge erred in ruling that the Secretary had failed to establish a recognized hazard. Recognition of the hazard, either by the employer or the employer's industry, is an element of the Secretary's prima facie case in proving a violation of the general duty clause. See Continental Oil Co. v. OSHRC, 630 F.2d 446 (6th Cir. 1980), cert. denied, 101 S.Ct. 1481 (1981); Beaird-Poulan, A Division of Emerson Electric Co., 79 OSAHRC 21/D11, 7 BNA OSHC 1225, 1979 CCH OSHD ¶ 23,493 (No. 12600, 1979); Empire Detroit Steel Division, Detroit Steel Corp. v. OSHRC, 579 F.2d 378 (6th Cir. 1978).

Judge Wienman defined the hazard in item 3(b) as the "absence of explosion relief venting." Based on that characterization of the hazard, he concluded that the record lacked sufficient evidence to show recognition of the hazard. However, we have held that a recognized hazard is not to be defined in terms of the absence of appropriate abatement measures. Beaird-Poulan, A Division of Emerson Electric Co., supra. The hazard identified by item 3(b) is the hazard of secondary grain dust explosions and fires in confined spaces such as elevator legs.

The record is replete with evidence both of Cargill's and of the grain handling industry's recognition of this hazard. To single out but some of this evidence, we take especial note that Cargill's own assistant manager testified that he is a member of the Static Metal Sparking Committee of the Explosion Research Council of the National Grain and

Feed Association and that one of the Committee's objectives is "to discover more about how a leg must be vented or how it can be vented safely." He described a number of experiments then being conducted regarding explosion relief for elevator legs and said he agreed with the Secretary's expert witness that the leg is the most hazardous area in a grain elevator and that adequate venting would substantially reduce the severity of grain dust explosions. In addition, the Secretary introduced into evidence a Literature Survey of Dust Explosions in Grain Handling Facilities: Causes and Preventions prepared by the Energy and Mineral Resources Researth Institute of Iowa State University. This survey states, in pertinent part,

> Usually the initial explosion is followed in close succession by one or more secondary explosions of much greater magnitude. The secondary explosions are presumably caused by suspension of dust, which has accumulated in other areas of the plant, by the initial or subsequent shock waves. . . . [T]here are areas during operation of a typical grain elevator where the formation of critical dust concentrations is almost inevitable. This is particularly true of the elevator legs which contain the bucket elevators which carry the grain to the head house at the top of the bins or silos.

The Secretary also entered into evidence a publication of the Farmland Insurance Company, which contains an article, "Explosion Vent Prevents Major Loss," describing an elevator leg grain dust explosion in which damage was minimized by an explosion relief vent.[2/] Accordingly,

---

2/ It is to be noted that although much of this evidence focuses on the feasibility of explosion relief venting, as well as on the capacity of grain dust to burn and explode, it was received into evidence and is being considered here for the limited purpose of determining recognition of the hazard, and not for the purpose of determining feasibility of abatement.

we conclude that the Secretary has established both industry and employer recognition of the hazard.

The second question to be resolved with respect to item 3(b) is whether the Secretary established feasibility of abatement. "A violation of the general duty clause cannot be sustained unless the Secretary is able (1) to establish the type of employer conduct necessary to avoid citation under similar circumstances and (b) to demonstrate the feasibility and likely utility of such conduct." Williams Enterprises, Inc., 79 OSAHRC 24/A2, 4 BNA OSHC 1663, 1666, 1976-77 CCH OSHD ¶ 21,071 at 25,361 (No. 4533, 1976); see also National Realty and Construction Co. v. OSHRC, 489 F.2d 1257 (D.C. Cir. 1973); Bomac Drilling, Division of TRG Drilling Corp., 81 OSAHRC 45/A2, 9 BNA OSHC 1681, 1981 CCH OSHD ¶ 25,363 (No. 76-450, 1981).

The Secretary suggested, through expert testimony, that Cargill abate the hazard by extending the sheet metal leg casings directly up through the grain elevator and feed mill roofs. The resultant roof-top vents should, according to the Secretary's expert, substantially reduce, if not eliminate, the number and intensity of secondary grain dust explosions in the event of an initial conflagration or deflagration.[3/]

In rebuttal, Cargill presented the uncontradicted testimony of its plant superintendent that it would be physically impossible to extend

---

3/ The Commission has held that "[i]t is sufficient if [a] method [of abatement] materially reduces, even though it may not eliminate, the hazard." Whirlpool Corp., 79 OSAHRC 32/A14, 7 BNA OSHC 1356, 1360, 1979 CCH OSHD ¶ 23,552 at 28,535 (No. 9224, 1979); see also Royal Logging Co., 79 OSAHRC 84/A2, 7 BNA OSHC 1744, 1979 CCH OSHD ¶ 23,914 (No. 15169, 1979), aff'd, 645 F.2d 822 (9th Cir. 1981); Titanium Metals Corp. of America v. Usery, 579 F.2d 536 (9th Cir. 1978); National Realty, supra.

the leg casings through the two roofs without piercing structural beams which support the roofs. He stated that to sever these structural members would weaken the roofs.

We have stated that once the Secretary has specified a method of abatement which would reduce or eliminate the incidence of the hazard, the employer may rebut the feasibility of that method with evidence "showing or tending to show that use of the method or methods established by Complainant will cause consequences so adverse as to render their use infeasible." Royal Logging Co., supra note 3, 7 BNA OSHC at 1751, 1979 CCH OSHD at p. 28,997. Cargill's plant superintendent testified that to extend the leg casings in the manner suggested by the Secretary would seriously weaken the roofs in question because the casings would have to pierce overhead supporting structures. This testimony was neither challenged nor rebutted by the Secretary, and there is nothing in this record to cast his testimony into doubt.

The Secretary contends on review that this rebuttal testimony does not disprove the feasibility of the recommended abatement because Cargill did not show that the extensions could not be constructed so as to avoid the overhead beams. However, it was the Secretary who specified in the first instance a form of abatement that would require cutting holes in the roof directly over the legs and in the same size and shape as the cross sections of the legs. For the Secretary to suggest now that extensions could have been installed in some way other than that proposed by the Secretary's expert at the hearing raises questions of fact for the first time on review. It is axiomatic that a reviewing tribunal should not decide a case on evidence not in the record, particularly

where, as here the "facts" are by no means certain. See National Realty, supra; 4 AM. JUR. Appeal & Error § 491 (1962).

The Secretary also points out that the judge made no finding of fact with respect to the question of whether direct vertical extensions would, indeed, weaken the roofs. However, it is the Commission, not the administrative law judge, who is the ultimate trier of fact. Accu-Namics, Inc. v. OSHRC, 515 F.2d 828, 834 (5th Cir. 1975), cert. denied, 425 U.S. 903 (1976). We conclude, in the face of the Secretary's failure to offer any evidence to the contrary, that Cargill has proved that incisions into overhead supporting beams would seriously weaken if not cause the collapse of the roofs involved.

Accordingly, we affirm the judge's vacation of item 3(b) on the ground that Cargill proved infeasibility of the proposed means of abatement.

III

Whereas item 3(b) was directed at the hazards of fire and explosion which follow upon an initial deflagration or conflagration of grain dust in elevator legs, item 3(c), the tramp metal charge, was directed at the capacity of ferrous metal to provide the initial ignition source due to friction sparking. It was the Secretary's contention that tramp metal could act as the ignition source for fire and explosion by releasing friction sparks in its progress through the metallic grain handling equipment.

Judge Wienman vacated that item on the ground that the record lacked sufficent proof of recognition of the hazard or the utility of the means of abatement. However, Judge Wienman never actually defined

the "recognized hazard" at issue under the tramp metal charge. In consequence it is not clear whether his references both to "recognized hazard" and to "utility of abatement" are to be taken as alternative grounds for vacation, or whether they reflect the judge's view of the hazard as lack of the recommended means of abatement, namely magnets and grating of the type described in the citation.

The hazard with which item 3(c) is concerned is the initial grain dust fire or explosion caused by tramp metal sparking. The judge's decision does not contain a finding as to whether the record shows, by a preponderance of the evidence, that either the grain handling industry or Cargill recognizes such a hazard. Accordingly, we remand the case on item 3(c) to the judge for an assessment of the evidence regarding this element of a general duty clause violation. In the event the judge determines that industry recognition of the hazard has been shown, then a determination as to the remaining elements of a general duty clause violation must be made.

IV

Judge Wienman ruled that NFPA 61B, "Grain Elevators Bulk Handling Facilites," is not "acceptable proof" of industry recognition of a hazard. NFPA 61B is a voluntary industry standard which has never been adopted as an OSHA standard and hence has neither the force nor effect of law. Judge Wienman concluded that this standard could not be used to establish industry recognition of a hazard because it applies only to facilities erected in 1973 or later and which are undergoing major replacement or alteration. Cargill's grain elevator and feed mill were constructed prior to 1973 and were not undergoing major renovation or replacement.

It is well established that voluntary industry standards are admissible and probative evidence of industry recognition of hazards. Bethlehem Steel Corp. v. OSHRC, 607 F.2d 871 (3d Cir. 1979); H-30, Inc. v. Marshall, 597 F.2d 234 (10th Cir. 1979); Titanium Metals Corp. of America v. Usery, supra note 3; Beaird-Poulan, A Division of Emerson Electric Co., supra; The Boeing Co., Wichita Division, 77 OSAHRC 188/D13, 5 BNA OSHC 2014, 1977-78 CCH OSHD ¶ 22,266 (No. 12879, 1977); cf. Betten Processing Corp., 75 OSAHRC 43/E2, 2 BNA OSHC 1724, 1974-75 CCH OSHD ¶ 19,481 (No. 2648, 1975) (ANSI standard used to show industry recognition of the hazard had been incorporated by reference into OSHA construction standards but had not been adopted in the general industry standards applicable to the Respondent's industry). The fact that this particular voluntary standard applies to facilities erected in 1973 or later and undergoing major replacement or renovation has no bearing on its relevance to industry awareness of certain hazards associated with grain dust and grain handling equipment. Accordingly, Judge Wienman's ruling that it is unacceptable proof of recognition is error.

Judge Wienman's vacation of item 3(b) is affirmed, for the reasons stated above. His vacation of item 3(c) is reversed and that item is remanded for disposition consistent with this opinion. SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

RAY H. DARLING, JR.
EXECUTIVE SECRETARY

DATED: FEB 26 1982

ROWLAND, Chairman, concurring in part and dissenting in part:

I concur with the majority's disposition of citation item 3(b), but I do not join in the majority's broad statement that a "hazard is not to be defined in terms of the absence of appropriate abatement measures." Concerning item 3(c), I dissent from the majority's decision to reverse the judge and remand the case. I would affirm the judge's decision to vacate citation item 3(c) on the grounds that the Secretary did not show recognition of the hazard or utility of the recommended means of abatement.

The majority correctly concludes with regard to item 3(b) that the Secretary established a recognized hazard of secondary grain dust explosions and fires in the confined spaces of the elevator legs at Cargill's facility. Insofar as the judge held to the contrary, he erred, but the error was harmless since, as the majority states, the judge correctly vacated the citation for failure of the Secretary to show a feasible method of abatement. In my view, it is sufficient to note that the judge committed harmless error, without reaching the issue of whether a hazard may be defined in terms of the absence of appropriate abatement.

As to item 3(c), Judge Wienman correctly described the hazard throughout his decision as "fires or explosions . . . attributed to tramp metal" and "tramp metal caus[ing] sparking and . . . an ignition source." The judge's description of the hazard is supported by the record and is indeed indistinguishable from the majority's own definition of the hazard. 4/

Consistent with the cases cited in the lead opinion, voluntary industry standards, such as NFPA 61B, are indicative of industry recognition of hazards

---

4/ The majority defines the hazard as "the initial grain dust fire or explosion caused by tramp metal sparking."

but do not conclusively prove recognition absent other credible and probative evidence. See, e.g., Bethlehem Steel Corp. v. OSHRC, 607 F.2d 871 (3d Cir. 1979) (recognition shown by evidence of voluntary private standard, admission that voluntary standard represented industry consensus, and evidence that standard generally followed in industry). Although the judge erred to the extent that he suggested that voluntary industry standards should never be accorded any weight, his error was harmless. In addition to stating that NFPA 61B was not "acceptable proof" of recognition, Judge Wienman examined the evidence - independent of that relating to NFPA 61B - and concluded that the record was insufficient to show that the hazard was recognized. The judge's conclusion reflects his implicit credibility evaluation of the testimony and usually should not be disturbed on review. Kus-Tum Builders, Inc., 81 OSAHRC 97/B2, 10 BNA OSHC 1128, 1981 CCH OSHD ¶ 25,738 (No. 76-2644, 1981). Accepting the judge's credibility determination, I conclude that the judge correctly held that the Secretary failed to show the hazard was recognized. 5/ Accordingly, I would affirm the judge's vacation of item 3(c).

Moreover, I would not disturb the judge's conclusion that the Secretary did not establish the utility of the proposed abatement measures. Neither party disputes on review the judge's determination that the magnets and screens, the recommended means of abatement, would not be useful. Since the propriety of the judge's determination regarding utility of abatement was not contested by the Secretary in his review petition nor directed for review by the Commission, the judge's conclusions on this issue are final. See Commission Rule 92(c), 29 C.F.R. § 2200.92(c). Since a violation of section 5(a)(1) cannot be

---

5/ The record does not establish that Cargill, as distinguished from the industry, recognized the hazard.

found unless the Secretary establishes the feasibility and utility of the recommended abatement, I dissent from the majority's decision to remand the case for further disposition.

|---|---|
| SECRETARY OF LABOR,<br><br>Complainant<br><br>v.<br><br>CARGILL, INC.,<br>NUTRENA FEED DIVISION,<br><br>Respondent | DECISION & ORDER<br>OSHRC DOCKET 78-5707 |

APPEARANCES: EUGENE F. DESHAZO, Esq., U.S. Department of Labor, Office of the Solicitor, Kansas City, Missouri, for the Complainant

ROBERT L. HOBBINS, Esq., Dorsey, Windhorst, Hannaford, Whitney & Halladay, Minneapolis, Minnesota, for the Respondent

Wienman, Judge, OSHRC:

## STATEMENT OF THE CASE

This is a proceeding wherein Respondent contests a Citation which charged multiple violations of the Occupational Safety and Health Act of 1970 (29 U.S.C. 651 et seq.) at a feed mill in McPherson, Kansas. The Citation alleged serious violations of specific OSHA regulations and Section 5(a)(1) of the Act, the so-called General Duty Clause. Penalties totalling $4,320 were proposed for the alleged violations. Respondent timely contested all items and penalties except item 4 for which a $630 penalty was

proposed. The cause was assigned to the undersigned Judge by an order of the Commission dated March 6, 1979, and a hearing was held in Wichita, Kansas, on June 28, 1979.

## THE ISSUES

No jurisdictional matters remain in issue. The parties pleaded facts sufficient to establish that Respondent is subject to the Act and that the Commission has jurisdiction of the parties and the subject matter.

Prior to the hearing the parties entered into an agreement terminating the contest with respect to all but two items. Remaining in dispute are items 3(b) and 3(c).

Item 3(b) alleged a violation of Section 5(a)(1), the General Duty Clause,[1/] as follows:

> The two pellet mill legs, the jack leg, the east and west elevator legs are not provided with explosion reliefs vents to the outside atmosphere exposing employee(s) to the hazards of fire and/ or explosion.

Item 3(c) alleged a violation of the General Duty Clause because three grain receiving pits were not provided with "permanent magnets, approved electromagnets, or specific gravity separators or screens of sufficient size to prevent entry of tramp metal into the

---

1/ Section 5. (a) Each employer--

> (1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees;

system."

The chief issues for decision are whether Respondent violated the Act as alleged. Ancillary issues relate to the mode and extent of the Secretary's use of the General Duty Clause in connection with items 3(b) and 3(c).

## SUMMARY OF THE EVIDENCE AND DISCUSSION

### Item 3(b): Explosion Relief Vents

Raymond R. Rogers, the OSHA Compliance Officer who inspected the facility in September 1978, provided a physical description of the workplace. Additional detail was supplied by Thomas Smolen, Plant Superintendent. The record contains no significant dispute as to the physical facts which are summarized from the testimony of Rogers and Smolen.

The cited facility is a feed mill plant which receives grain (corn and milo) and certain other commodities and processes them into animal feed products. The facility consists of a reinforced concrete elevator, where grain and commodities are received and briefly stored, and a sheet metal mill building in which the ingredients are processed. The grain elevator was built in 1959, and the feed mill erected in 1965. Cargill acquired the plant in 1967. The chief grain handling equipment consists of two 180 foot vertical conveyors or "legs" located in the elevator. The grain processing equipment includes various mills and grinders mainly located in the mill building (T. 7-8, 98-100, 118).

Complainant cited five of six conveyor legs in the elevator and

mill as presenting fire and explosion hazards for want of relief venting to the outside atmosphere. The sixth, a "mixer leg," was equipped with 6" x 6" air relief vent (T. 136) and was not cited upon Rogers' recommendation (T. 12-13). During the hearing the Secretary elected to withdraw the allegations as to two pellet legs, conceding they were unlikely to contain an explosive concentration of dust (T. 132).

Bruce Carl Beelman, an OSHA supervisory safety specialist who currently serves on a National Academy of Science Committee studying grain elevator explosion and fires (T. 46), explained the theory and function of explosion relief venting. In the event of an initial explosion, relief vents serve to prevent propagation to other portions of the workplace (T. 57). This is particularly important because initial explosions in grain elevators do not cause the majority of the damage. Subsequent explosions increase in intensity as more dust is lifted and placed in suspension (T. 58). Beelman also testified that the highest dust concentrations were generally found within the elevator legs and that the leg was "the number one source" of elevator explosions whose causes were known (T. 60).

Beelman disclaimed any qualifications as an expert able to calculate the venting area necessary to provide explosion relief for a given structure (T. 79), but nevertheless asserted that relief venting of the cited legs could be accomplished by extending simple ducts directly through the roof above the legs (T. 84).

Respondent took sharp issue with Beelman's testimony relative

to feasibility. Under cross-examination Beelman was unable to name an authoritative source setting forth guidelines for venting an elevator leg (T. 81). He further conceded that NFPA No. 68, a source document he relied on, consisted entirely of "recommended practices" as opposed to industry "requirements" (T. 81). The National Academy of Science Committee he served on was considering recommending that elevator legs be provided with vents equal to the cross section of the leg, but no final recommendation had been made (T. 79).

As to industry practices, Beelman testified 60 to 70 percent of the facilities OSHA inspects have "some type of venting system" (T. 88), but the vents are not as large as cross-sectional areas of the legs (T. 89). What percentage of the inspected elevators are equipped with vents designed to relieve explosive pressures as opposed to simple breather pipes which merely prevent creation of vacuums inside the legs was not clear from Beelman's testimony.

John A. Johnston, assistant manager of Cargill's grain research laboratory, testified that he served as chairman of the Static and Metal Sparking Committee of the Explosion Research Council of the National Grain and Feed Association (T. 152). He regularly reviews technical information concerning grain elevator safety, and testified that Cargill was involved in a project to conduct venting and explosion suppression tests on elevator legs with the Explosion Research Council (T. 167).

Johnson testified that the formula for determining explosion

relief is most commonly expressed as a ratio of vent area to the cubic volume of the vessel but that a number of variables affected the formula: the shape of the vessel, the nature of the material, type of dust, temperature, pressure, etc. Also, unusually shaped containers, especially long, narrow ones, pose special problems, and no expert to date has established a formula for explosion venting relief of elevator legs (T. 160-161).

A review of the testimony reveals a number of shortcomings in Complainant's effort to establish a violation as alleged in item 3(b). However desirable it may be to provide elevator legs with explosion relief venting, the proof does not indicate (1) that this is a generally recognized practice within the industry and (2) that explosion relief venting of the cited legs was feasible by the means suggested by the OSHA representatives. The elements of proof in a General Duty Clause violation case were stated by Judge J. Skelly Wright in National Realty and Contruction Co., Inc., v. OSHRC and Secretary of Labor, 489 F.2d 1257 (D.C. Cir., 1973). Not only must the Secretary prove that the employer failed to render its workplace free of a recognized hazard causing or likely to cause death or serious physical harm, but "the Secretary must be constrained to specify the particular steps a cited employer should have taken to avoid citation, and to demonstrate the feasibility and likely utility of those measures." 489 F.2d 1257, 1268

Because the secretary failed to meet this burden, item 3(b) must be vacated.

Item 3(c): Tramp Metal

Acting upon an OSHA instruction that a General Duty Clause violation may be recommended on the basis of provisions found in NFPA No. 61B-1973,[2/] Compliance Officer Rogers cited Respondent for lack of adequate screens, magnets, or other devices to prevent entry of tramp metal into the system at the grain receiving pits. Rogers observed that Respondent's receiving pits were protected only by wide grates with openings approximating 2 1/2" x 12" (T. 10). Rogers, who had inspected approximately four similar facilities before September 1978, testified that the grates were typical of those that he had observed at other elevators (T. 24), but he nevertheless recommended the Citation. The hazard, he warned, was that tramp metal causes sparking and could prove an ignition source. He could identify no grain elevator explosion which had been reliably attributed to tramp metal (T. 15). He also admitted that prior to September 1978 he had never seen a magnetic separation device in use (T. 24).

Mr. Beelman came closer to attributing a grain elevator explosion to tramp metal, stating that OSHA investigators had concluded that tramp metal was the most likely cause of an elevator explosion which had occurred in Garvey, Kansas (T. 49-52).

As to feasible abatement means, Beelman testified that a number

---

2/ A standard for the prevention of fire and dust explosions in grain elevators and bulk grain handling facilities adopted by the National Fire Protection Association at its 1973 annual meeting.

of studies had determined that grates with 1 1/2" openings did not affect production flow (T. 71). On cross-examination Beelman admitted that out of 1500 elevators in Kansas, he knew of only 5 which were equipped with 1 1/2" square mesh grates, and only about 20 to 25 percent had magnetic protection in their receiving pits (T. 72).

John Johnson, Respondent's chief rebuttal witness, countered by stating that all reliable studies indicated that metal sparks alone were not of sufficient energy to cause an explosion. He did concede that the friction of rubbing metal might initiate an explosion or fire (T. 153). Johnson contended that there was no reliable basis for asserting that tramp metal was a hazard in grain handling equipment and that no existing industry practice required special devices above and beyond the type of grating in place at the McPherson elevator (T. 154). He stated that he knew of no fires or explosions reliably attributed to tramp metal and that the combination of the grates and auger at the McPherson plant prevented the entry of any metal large enough to cause a fire or explosion by friction (T. 156).

There are a number of deficiencies in the Secretary's case, chief of which is the reliance upon NFPA No. 61B-1973 as the basis for allegations of a General Duty Clause violation. The Forward to NFPA No. 61B expressly states that the standard applies only to facilities erected subsequent to the date of the standard and is an advisory guide for owners or operators engaged in major replacement or renovation of existing facilities. Since both the elevator and

mill structures were erected in the 1960's, NFPA No. 61B-1973 has advisory application only to the McPherson facility. We have labored the point in other decisions, but it is suffice to repeat our conviction that advisory provisions of a private industry standard are not acceptable proof of industry recognition of a hazard. The Secretary seeks to impose new and disputed technology upon the industry as a means of reducing the incidence of grain elevator explosions. Time may prove the Secretary correct, but the record contains insufficient independent proof of a recognized hazard or the utility of the recommended technology to support the Citation. Item 3(c) must be vacated.

## FINDINGS OF FACT

1. A preponderance of the reliable, probative, and substantial evidence supports the findings of fact set forth in the Summary of Evidence and Discussion.

2. The parties entered into an agreement settling all but two disputed issues prior to trial. The terms of the agreement are set forth on transcript pages 4-6. No reason appears why the agreements contained therein should not be approved by the Commission.

## CONCLUSIONS OF LAW

1. At all material times Respondent was an employer within the meaning of Section 3 of the Occupational Safety and Health Act of 1970.

2. Jurisdiction of this proceedings is conferred upon the Occupational Safety and Health Review Commission by Section 10(c) of

the Act.

3. The mutual agreements set forth on pages 4-6 of the transcript are consistent with the purpose of the Act. In all instances where the Secretary has agreed to modify a Citation item or penalty proposal, and in all instances where the Respondent has agreed to withdraw its Notice of Contest to a Citation item, the parties are bound by their respective agreements. All Citation items thus settled by mutual agreement are amended to conform with the express terms of the agreement.

4. With respect to the remaining disputed items, namely, items 3(b) and 3(c), the evidence fails to establish the existence of violations of Section 5(a)(1) of the Occupational Safety and Health Act of 1970.

## ORDER

Based on the above Findings of Fact and Conclusions of Law, it is ORDERED that:

1. Citation items subject to settlement by stipulation of the parties are modified, vacated, or affirmed according to the agreed terms, namely:

(a) Items 1 and 6 of Citation Number 1 issued to Respondent October 26, 1978, are vacated.

(b) Item 3(a) of said Citation is affirmed and a penalty in the sum of $100 assessed thereon.

(c) Item 5 of said Citation is affirmed and a penalty of $540 assessed thereon.

(d) Item 7 of said Citation is modified to allege a nonserious violation of Section 110-17(a) of the National Electrical Code, NFPA 70-1971, as adopted by 29 CFR 1910.309(a). Item 7, as modified, is affirmed without monetary penalty.

(e) Item 8 of said Citation is affirmed and a penalty in the sum of $500 assessed thereon.

2. The disputed serious violations, namely, items 3(b) and 3(c) of Citation Number 1 issued October 26, 1978, are vacated.

Date: November 8, 1979

| SECRETARY OF LABOR, | : | |
| Complainant, | : | |
| v. | : | OSHRC Docket No. 78-5956 |
| CORNELL & COMPANY, INC., | : | |
| Respondent. | : | |
| | : | |

DECISION

Before, ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

A decision of Administrative Law Judge Seymour Fier is before the Commission pursuant to section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). Judge Fier affirmed a citation alleging that Cornell & Company, Inc., violated section 5(a)(1)[1/] of the Act because "[e]mployees were allowed to work under a beam suspended above [their] heads . . . [while] installing [a] lower beam suspended from [the] same hook. . . ."

In response to Cornell's petition for discretionary review, former Commissioner Barnako directed review on the following issues:

> (1) Whether the judge erred in concluding that the provisions of the New Jersey Administrative Code, specifically subchapter 20.16.5(5) of the Construction Safety Code, establish recognition of a hazard within the meaning of 29 U.S.C. § 654(a)(1).

---

1/ Section 5(a)(1), 29 U.S.C. § 654(a)(1), provides that "[e]ach employer . . . shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees."

> (2) Whether a violation of 29 U.S.C. § 654(a)(1) can be found in view of the provisions of 29 C.F.R. § 1926.550(b)(2).
>
> The parties are also requested to address the following question:
>
> Whether the provisions of ANSI standard B-30.5 noted in Respondent's Memorandum in Support of Petition for Review are not mandatory and, if those provisions do not impose mandatory requirements, whether such fact constitutes a determination by the Secretary of Labor that the work practices in issue are not hazardous, so that a citation alleging violation of 29 U.S.C. § 654(a)(1) is improper.

Because we conclude that 29 C.F.R. § 1926.550(b)(2) applies to the hazard cited by the Secretary of Labor, we vacate the citation under section 5(a)(1).[2/]

Section 1926.550(b)(2) provides that "[a]ll crawler, truck, or locomotive cranes in use shall meet the applicable requirements for design, inspection, construction, testing, maintenance and operation as prescribed in the ANSI B30.5-1968, Safety Code for Crawler, Locomotive and Truck Cranes." Section 5-3.2.4(b) of ANSI B30.5-1968 provides that "[n]o person should be permitted to stand or pass under a load on a hook." It appears that a truck crane was being used in this case.[3/] Also, because

---

2/ Because we conclude that the citation to § 5(a)(1) was inappropriate, we do not reach the first directed issue, concerning the Secretary's proof of a recognized hazard under section 5(a)(1).

3/ Respondent's vice president testified that the facts in this case were similar to those in an earlier case in which Respondent was cited for violating section 5(a)(1). The citation, which Respondent placed in evidence (Exh. R-3), alleged that a truck crane was being used. Also, the judge's decision, which Respondent placed in evidence (Exh. R-1), indicates that the Secretary's evidence in that case was that Respondent was using a truck crane. The citation was vacated because the Secretary failed to establish a recognized hazard. When this evidence was presented at the hearing in this case, Respondent had already raised the possibility that a standard, § 1926.550(b)(2), applies. However, the Secretary offered no rebuttal to

(continued on next page)

the Secretary's concern was that Cornell's employees who were installing the lower of two beams suspended from the same hook were standing under the upper beam, the hazard brought under section 5(a)(1) is the same one covered by section 1926.550(b)(2) and ANSI section 5-3.2.4(b). Accordingly, there is a standard which applies to the hazard cited under section 5(a)(1) in this case.

Citation to section 5(a)(1) is inappropriate where a standard applies to the hazard in the case. Mississippi Power & Light Co., 79 OSAHRC 109/D12, 7 BNA OSHC 2036, 1980 CCH OSHD ¶ 24,146 (No. 76-2044, 1979), citing Brisk Waterproofing Co., 73 OSAHRC 30/E1, 1 BNA OSHC 1263, 1973-74 CCH OSHD ¶ 16,345 (No. 1046, 1973). Because ANSI section 5-3.2.4(b) applies to the hazard in this case, the standard incorporating this ANSI provision, section 1926.550(b)(2), preempts section 5(a)(1). See A. Prokosch & Sons Sheet Metal, Inc., 80 OSAHRC 96/A2, 8 BNA OSHC 2077, 1980 CCH OSHD ¶ 24,840 (No. 76-406, 1980). Accordingly, citation to section 5(a)(1) in this case was inappropriate and the citation must be vacated. SO ORDERED.

FOR THE COMMISSION

Ray H. Darling Jr.

RAY H. DARLING, JR.
EXECUTIVE SECRETARY

DATED: FEB 26 1982

---

3/ (continued)

the vice president's testimony and Respondent's exhibits. Moreover, the Secretary does not contend that the crane was not a type covered by § 1926.550(b)(2). Therefore, on the basis of Respondent's evidence, we find that the crane used in this case was a truck crane.

COTTINE, Commisioner, dissenting:

The majority decision is dependent on one critical fact - the type of crane used by Cornell at this worksite. Unless the crane is a crawler, locomotive or truck crane, 29 C.F.R. §1926.550(b)(2) does not apply.[1/] There is no evidence in the record that Cornell's crane is a truck crane, or a crawler or locomotive crane. My colleagues essentially acknowledge that there is no probative evidence on this point because they state, "It appears that a truck crane was being used in this case." Slip op. at 2 (emphasis added). Factual issues, however, must be decided on the basis of record evidence.

The majority's inference in this case is predicated on a prior citation issued to the Respondent for a section 5(a)(1) violation at a different construction worksite involving a truck crane. Based on the testimony of the Respondent's vice president that these cases are "similar", the majority concludes that the crane used at this worksite must be a truck crane because a truck crane was used at the other worksite. Reasonable inferences may be drawn from circumstantial evidence, i.e., "circumstances having been found by experience so associated with that fact that in the relation of cause and effect they lead to a satisfactory conclusion." 1 JONES ON EVIDENCE §1.3 at 4 (6th ed. 1972). However, in the absence of additional evidence linking the characteristics of the

---

1/ §1926.550 Cranes and derricks.

* * *

(b) Crawler, locomotive, and truck cranes .

* * *

(2) All crawler, truck, or locomotive cranes in use shall meet the applicable requirements for design, inspection, construction, testing, maintenance and operation as prescribed in the ANSI B30.5-1968, Safety Code for Crawler, Locomotive and Truck Cranes.

cranes or the conditions of use together, the inference in this case bears no relation to fact or experience.[2/] There is no reasonable association between the type of crane used at one construction site and those used at another site without additional evidence. An illustrative example of circumstantial evidence is given in JONES ON EVIDENCE:

> [W]hen footprints are discovered subsequent to a recent snow, it is proper to infer that some animated being passed over the snow after it fell; and from the form and number of the footprints it can be determined whether they are those of a man, a bird or a quadruped.

Id. Regrettably, the crane in this case left no tracks in the snow or imprint on the record. The only "satisfactory conclusion" sought by the majority in this case is a factual basis to apply the Commission's precedent in A. Prokosch & Sons Sheet Metal, Inc., 80 OSAHRC 96/A2, 8 BNA OSHC 2077, 1980 CCH OSHD ¶24,840 (No. 76-406, 1980). Unfortunately, there is no evidentiary basis for my colleagues' conclusion that "there is a standard which applies to the hazard cited under section 5(a)(1) in this case."

The majority's legal conclusion is also untenable. The majority concludes that the Secretary will not be permitted to prove an allegation that Cornell exposed its employees to serious, recognized hazards prohibited by section 5(a)(1) of the Act, 29 U.S.C. §654(a)(1), because a specific standard covers the working conditions involved here. However, no such standard applies. An occupational safety and health standard is expressly defined under the Act as "a standard which requires conditions . . . reasonably necessary or appropriate to provide safe or healthful employment and places of employment." Section 3(8) of the Act, 29 U.S.C. §652(8). All that §1926.550(b)(2) does is to incorporate by reference certain

---

2/ Moreover, the absence of any rebuttal by the Secretary to the Respondent's evidence regarding the previous citation does not affirmatively establish or support any inference concerning the identity of the crane.

applicable requirements in ANSI B30.5-1968. See note 1 supra. The ANSI provision said to be applicable by the majority, section 5-3.2.4(b), is not a requirement.[2/] It is merely advisory.[3/] Therefore it is not an applicable standard nor a requirement incorporated by reference in the OSHA standard. It does not preclude the Secretary from citing the alleged hazards under section 5(a)(1) of the Act. See A. Prokosch & Sons Sheet Metal, Inc., supra, 8 BNA OSHC at 2082, 1980 CCH OSHD ¶24,840, p. 30,630 (No. 76-406, 1980) (Cottine, Commissioner, dissenting).

---

2/ Section 5-3.2.4(b) provides: "No person should be permitted to stand or pass under a load on the hook."

3/ ANSI B30.5-1968, Introduction, Section V, states:

> Mandatory rules of this Code are characterized by the use of the word "shall." If a rule is of an advisory nature it is indicated by the use of the word "should" or is stated as a recommendation.

## DECISION AND ORDER

FIER, JUDGE:

## PRELIMINARY STATEMENT

This is a proceeding pursuant to section 659 of the Occupational Safety and Health Act of 1970 (29 U.S.C. section 651 et seq., hereinafter called the Act), wherein Respondent contests the citation and penalty for one serious violation and one nonserious violation. The citations were dated

November 21, 1978 and were issued with the proposed penalty pursuant to sections 9(a) and 10(a) of the Act. The citations were based on an inspection conducted November 15, 1978.

Pursuant to section 10(c) of the Act, 29 U.S.C. section 659(c), Respondent, through a letter dated December 8, 1978, noted its timely contest to the citations and proposed penalty.

The standards which were violated are set forth as 29 U.S.C. 654 section 5(a)(1) with a proposed penalty totaling $720.00 and 29 CFR § 1926.450(a)(1) with no penalty proposed.

## I S S U E S

The following issues are pertinent to the disposition of this case:

1. Did the Respondent fail to provide a place of employment that was free from recognized hazards which were likely to cause death or serious physical harm to employees?

2. Did Respondent violate section 29 CFR 1926.450(a)(1)?

3. If the Respondent is found to have violated any or all of the above, what penalty or penalties, if any, should be assessed for any of the violations of the Act.

## STATEMENT OF THE EVIDENCE

The Respondent, Cornell & Company, Inc. (hereafter referred to as Cornell), by stipulation admits that it is

licensed to do business as a corporation in the State of New Jersey (Tr. 3).* The company is engaged in a business affecting commerce since the company uses equipment manufactured outside of the state and does work in other states (Tr. 3). There are approximately 150 employees of the Respondent (Tr. 3). The Respondent also acknowledges that it has a prior history before the Occupational Safety and Health Administration (Tr. 3).

On November 15, 1978, Harry Clugston, the Compliance Officer (hereafter referred to as C.O.), inspected Respondent's worksite (Tr. 4, 6). This was a multi-employer site in which Robert McDonald of Cornell was in charge at the time (Tr. 6). Respondent was erecting a steel frame on an existing building in Atlantic City, New Jersey (Tr. 7).

The C.O. issued a citation for a violation of section 5(a)(1) of the Occupational Safety and Health Act when he observed Cornell's employees transporting structural steel beams with a crane, in a tandem or "Christmas tree" fashion, to the third floor level (Tr. 7-8, 17). The C.O. testified that these steel beams swung over the heads of the workers in a dangerous manner specifically prohibited by the New Jersey State Safety Code since 1963. At the time of the violation, the steel was about 100 feet up with the beams separated about 7 to 8 feet above the employees' heads (Tr. 24). The length of a beam was about 16 feet and the weight was approximately 1,000 pounds or more (Tr 25-26). He further

---

*Denotes transcript page.

commented that the "Christmas tree" practice, as it is known in the trade, has almost disappeared due to past State enforcement of the statute (Tr. 8). The enforcement of the New Jersey statute has been "turned over" to Federal jurisdiction (Tr. 9-10).

The C.O. testified that it was a routine practice on the the jobsite for two beams, one over one, to be installed simultaneously (Tr. 8). It was the C.O.'s opinion that the upper beam could be moved or tilted by a gust of wind, by mechanical failure of the crane, or some other difficulty possibly striking and killing an employee or employees (Tr. 9). The C.O. indicated that the Respondent should have picked up the beams one at a time or set the top beam first and then the bottom beam, so that the employees would not be endangered. According to testimony, Mr. McDonald's only comment to the C.O.'s suggestion at the time was that he had not thought of it.

The Respondent introduced into evidence a copy of a decision by Judge Henry McQuade dated March 30, 1979, Secretary v. Cornell and Co., CCH OSHD ¶ 23,577, (Docket No. 78-2723, 1979) dealing with identical issues and parties as in the instant case. The only purported difference between Judge McQuade's case and the instant case was one of location, with the former's site of violation being in Philadelphia, Pennsylvania (Tr. 14-15). The C.O. stated that had he observed the same

condition in Philadelphia, he would have issued a citation for the violation (Tr. 16). Other companies were cited for this violation in other areas, although to his personal knowledge, no worker had been hurt by the use of this practice (Tr. 18).

Since there was no specific standard covering this practice, the Respondent was cited under section 5(a)(1), relying on the New Jersey Code (Tr. 20-21) as a basis for the violation. The New Jersey standard was not incorporated under section 1926 of the Act or under the subpart for steel erection (Tr. 23-24). The New Jersey Safety Code is an extant state regulation, although it is not presently being enforced (Tr. 28-29).

Mr. Jack C. Sheppard, Vice-President of Cornell, testified that tandem lifting or "Christmas Treeing" is hazardous, but by taking certain risks, Cornell is minimizing other risks by reducing the number of times the boom must pass over the structure to install the steel (Tr. 54-55). Mr Sheppard further testified that if the New Jersey standard was enforced, no buildings would be erected (Tr. 61). He also pointed out that a National Steel Erection Code exists, entitled Construction of Structural Steel Building Frames, by Bill Rapp, (Tr. 63). On page 303, part 2.27, the book states that separate choked slings must always be used when picking up two pieces of steel at the same time and mentions tandem lifting (Tr. 64-65).

The witness stated that he was familiar with the New Jersey law, but had thought it was superseded by OSHA (Tr. 71). Although he recognized that it was part of the New Jersey safety code, he believed it was not strictly enforced (Tr. 72).

As to the nonserious violation of 29 CFR 1926.450(a)(1), the C.O. testified that he observed a Cornell employee, Mr. Jerry Johnston, climbing a column 10 feet up without using a ladder (Tr. 13). This violation was deemed nonserious because any resultant injury due to a fall from so low a height would not be serious, and thus, no penalty was proposed. The C.O. admitted however, that he was not sure whether any ladders were provided but he had observed none (Tr. 38).

## O P I N I O N

The question to be determined herein, is whether in the language of section 5(a)(1) of the Act, Respondent met the requirement that he furnish to each of his employees a place of employment which was free from "recognized" hazards, thst are causing or likely to cause death or serious injury to his employees. Complainant has charged Respondent with violating section 5(a)(1) because the employer allowed steel beams to be lifted in tandem above the employees, causing an overhead hazard. To establish a violation of section 5(a)(1), the Secretary must prove: (1) that the employer failed to

render its workplace "free" of a hazard which was (2) "recognized" and (3) causing or likely to cause death or serious physical harm to its employees. National Realty and Construction Co., Inc., v. OSHRC, 489 F.2d 1257 (D.C. Cir. 1973).

Respondent states that the Secretary has not carried his burden of proof with respect to the "Christmas Treeing" practice, as tandem lifting is known in the trade. Respondent's witness stated that "Christmas Treeing" has, to his knowledge, caused no injuries to any employee at Cornell or at any other company (Tr. 55-56). The C.O.'s testimony supports this contention (Tr. 18). However, one purpose of the Act is to prevent the first accident from occurring and a history of no injuries does not in itself prove that a practice is not a "recognized" hazard. Lee Way Motor Freight, Inc. v. Secretary, 511 F.2d 864, 1 OSHC 1689 (10th Cir. 1975).

In addition, to support its contention that "Christmas Treeing" is not a "recognized" hazard, Respondent testified that there was no specific OSHA standard, nor is there any collective bargaining agreement, prohibiting this practice (Tr. 62). The fact that there is no specific OSHA standard does not automatically lead to the conclusion that there is no "recognized" hazard. That is, indeed, the reason for this citation falling within the purview of the general duty clause provision. Furthermore, the National Steel

Erection Code, by S.A.E. entitled Construction of Structural Steel Building Frames, by Bill Rapp, which Respondent entered into evidence, does not prove that tandem lifting is not a recognized hazard. Page 303, part 2.27 which describes the manner in which tandem lifting should be accomplished, does not by its inclusion in the Code, prove that tandem lifting is recognized as a safe industry practice (Tr. 64-65).

Respondent also entered into evidence a copy of a decision dated March 30, 1979, in which Judge Henry McQuade held that Cornell did not violate the general duty clause because tandem lifting was not proven to be a "recognized" steel erection industry hazard in Philadelphia (Tr. 14-15). The Secretary was allowed, in that case, to elicit testimony to the effect that although "Christmas Treeing" was done in the Philadelphia area, it was not condoned because it was hazardous. Secretary v. Cornell and Company, CCH OSHD ¶ 23,577 (Docket No. 78-2723, 1979). In Philadelphia, the Secretary did not carry its burden of proof because there was no statute, as there is in New Jersey, proscribing tandem lifting. Thus, Judge McQuade had more latitude in determining what constitutes a "recognized" industry hazard than is possible in this case where there is a state law prohibiting the practice.

In Secretary v. Mid-Hudson Automatic Sprinkler Co., Inc., Docket No. 76-0576 (Oct. 12, 1976), this forum held that,

"A statute even though it has been repealed for various reasons, may still be received as part of the total evidence to identify an industry-wide practice and existing hazard." Since, in the instant case, the statute in question has not been repealed, further weight is given to the Secretary's allegation that the instant case should be distinguished from Judge McQuade's decision.

Respondent testified that the reason Cornell used "Christmas Treeing" was to reduce the number of times the boom must pass over the structure to install the steel and thus to eliminate some of the hazard (Tr. 54-55). Although Respondent contends that double stringing might minimize the risks of hoisting steel beams, he admitted that it is still a risky practice (Tr. 58-60). He also stated that Cornell did not utilize tandem lifting as a matter of course, but only under particular circumstances (Tr. 58).

Therefore, despite Respondent's arguments to the contrary, the Secretary has established the presence of a "recognized" hazardous condition. The Respondent's own statements to the effect that double stringing can be considered a hazardous practice and that it is the type of risk that men expect to take when they work in this field, establish actual knowledge of the hazardous nature of tandem lifting on the part of Cornell (Tr. 58).

Moreover, since 1973, Courts have recognized that a number of factors can be considered in determining whether a hazard is "recognized." Lack of industry reognition of a hazard does not suffice to prove that there is no recognized hazard. It may be fair to hold an employer to a higher standard of care than industry practice recommends. Cape and Vineyard Division v. OSAHRC, 512 F.2d 1148 (1st Cir. 1975), Secretary v. Southern Railway Co., 3 OSHC 1657 (R.C. 1975).

In the instant case, the New Jersey Administrative Code, Chapter 12.180-20.16.5(5) (Tr. 10) (Court Exhibit C-1) supports the Secretary's allegation that double stringing was a recognized hazard in the State of New Jersey since the early 1960's. Although standards may vary from state to state, the fact that New Jersey promulgated a statute prohibiting this practice is sufficient to establish a violation of section 5(a)(1) for the construction site in question. Secretary v. Puget Sound Power and Light Co., 10 OSAHRC 844, 1 BNA OSHC 1046, 1971-73 CCH OSHD ¶ 15,189 (Docket No. 15, September 28, 1972); Brennan v. OSAHRC, 494 F.2d 460 (8th Cir. 1974).

The Secretary has established the presence of a "recognized" hazardous condition. The question of actual knowledge is established by the admission of Respondent's witness that he knew of the New Jersey Act and has been with Respondent's New Jersey company since 1951 (Tr. 71, 82). Secretary of Labor v. Ford Motor Co., 5 OSHRC 1765, 5 BNA OSHC 1765, 1977-78 CCH OSHD ¶ 22,106 (Docket No. 13682, 1977). The evidence therefore,

goes further than required since once a practice is proven of a "recognized" hazard in the inudstry, the Secretary need not prove actual knowledge on the part of the employer. National Realty and Construction Co. v. OSAHRC, supra.

Therefore, the Secretary has carried its burden of proof with respect to the section 5(a)(1) violation and the citation is affirmed. The criteria for assessing the penalty included reductions of the $900.00 unadjusted penalty on the basis of size and good faith. No reduction was allowed for history, since Cornell has a previous history of violations of OSHA. The adjusted penalty of $720.00 is not disproportionate to the danger involved in this hazard, and is, therefore, affirmed, according to section 17 of the Act.

The second citation is concerned with a violation of section 1926.450(a)(1). The Secretary has met its burden of establishing a prima facie case in that the worker was observed by the C.O. climbing the column without using a ladder or stairs. If ladders were provided, it is a reasonable assumption that the employee would have used them. As it stands, no ladder was observed as being available at the site, much less being used by the employees. Even if ladders were available, the Respondent had a duty to see that his employees used them as a proper means of safe access (Tr. 41-42). Since there was little danger of serious injury, the affirmance of the violation without penalty is reasonable.

## FINDINGS OF FACT

The credible evidence and the record as a whole establishes preponderant proof of the following facts:

1. Respondent, Cornell and Company, Inc., is engaged in the erection of steel. It is engaged in a business crossing state lines and uses equipment manufactured outside the state. The materials used and effects on commerce establish that it is engaged in interstate commerce.

2. The practice known as tandem lifting or "Christmas Treeing" was a recognized hazard likely to cause death or other serious injury to Respondent's employees.

3. The hazard created by the steel beams swinging over the heads of employees were within the scope of Respondent's knowledge. Tandem lifting was known to Respondent for many years to be specifically prohibited because of the hazard involved.

4. Tandem lifting is specifically prohibited by New Jersey Adminstrative Code, Chapter 12.180-20.16.5(5).

5. Respondent did not have ladders provided at the work-site for employee use.

6. An employee of Res ondent was observed climbing a pole 10 feet high in violation of 29 CFR 1926.450(a)(1).

7. The Respondent did not prevent its employee from climbing the 10-foot column.

## CONCLUSIONS OF LAW

1. The Respondent is and was at all times herein, engaged in a business affecting commerce within the meaning of section 3(5) of the Occupational Safety and Health Act of 1970.

2. The Occupational Safety and Health Review Commission has jurisdiction over the subject matter and parties to this action.

3. The Respondent violated section 5(a)(1) by failing to provide its employees with a place of employment which was free from "recognized" hazards that are causing or likely to cause serious injury or death to its employees.

4. The Respondent violated section 1926.450(a)(1) by not providing safe access to all elevations.

## O R D E R

Upon the basis of the foregoing facts and conclusions of law, and upon the the entire record, it is hereby ORDERED that:

Citation number one, item one, is affirmed. A penalty of $720.00 is assessed.

Citation number two, item one, is affirmed with no penalty.

DECISION

Before ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

A decision of Administrative Law Judge Alan M. Wienman is before us for review pursuant to section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). Cargill, Inc., Nutrena Feed Division ("Cargill") was charged with two violations of section 5(a)(1) of the Act, 29 U.S.C. § 654(a)(1),[1/] the "general duty clause." Judge Wienman vacated both items on the ground that the Secretary of Labor had failed to carry his burden of proof. Commissioner Cottine granted the Secretary's petition for review and directed review of two issues:

---

1/ Section 5(a)(1), 29 U.S.C. § 654(a)(1), provides:

> Sec. 5(a) Each employer —
>
> (1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees.

1. Whether the ALJ erred in vacating the alleged violation of § 5(a)(1) on the grounds that the Secretary had failed to prove the existence of a recognized hazard and feasible means of abatement.

2. Whether the ALJ erred in vacating item 3(c) of the citation, alleging a violation of § 5(a)(1), on the ground that NFPA Standards "are not acceptable proof of industry recognition of a hazard."

For the reasons that follow we affirm the judge's decision as to one item and reverse and remand as to the other.

I

Cargill operates a grain elevator and feed mill where grain and commodities are processed into animal feed. The elevator was built in 1959, the feed mill in 1965, and both were acquired by Cargill in 1967. Both the grain elevator and the feed mill contain vertical conveyors called "legs," which consist of flexible belts equipped with buckets that pull grain and other materials from one level to another. The belts are enclosed in shafts composed partly of sheet metal and partly of concrete.

Grain and commodities are delivered to Cargill by truck and train and off-loaded into receiving pits which are covered by steel grates. The grates over the grain pits form openings of about two inches by twelve inches, and the grates over the commodity pits form openings of about two-and-one-half inches by nine inches. The grain and commodities are transported from the pits by screw conveyors which have a tolerance of about three-eighths of an inch.

In November 1978 this facility was cited for several violations of the Act, including the two items at issue here, item 3(b) and item 3(c). The gravamen of item 3(b) is that those legs which were used by Cargill to transport grain present hazards of secondary grain dust fire

and explosion because the legs are not equipped with explosion relief venting. As the Secretary explained at the hearing, the presence of explosion relief venting in the cited legs would not prevent a grain dust fire or explosion in the first instance, but it would prevent secondary fires and explosions. Secondary grain dust fires and explosions occur when an initial dust explosion in a confined space creates pressure waves which raise additional dust into suspension, leading to a series of explosions of increasing intensity. As a means of abatement, the Secretary suggested that Cargill extend the sheet metal casings at the top of the legs directly up through the roofs of the two buildings so that in the event of a grain dust explosion, the resulting pressure waves could move up and out of the leg without causing secondary explosions and fires.

Item 3(c) alleged that Cargill's receiving pits should have been equipped with permanent magnets, approved electromagnets, or specific gravity separators or screens capable of preventing entry of tramp metal into the processing system. "Tramp metal" is ferrous material which accidentally gets mixed in with the grain and commodities as they are transported from the farm to various processors. The gravamen of this charge is that the tramp metal can, as a result of frictional contact with Cargill's metal processing machinery, give off sparks. The Secretary alleges that these sparks could provide the ignition source for grain dust fires or explosions.

Judge Wienman vacated both items on the ground that the Secretary had failed to prove the existence of a recognized hazard or a feasible means of abatement. He also ruled that the National Fire Protection Association Standard 61B ("NFPA 61B"), "Grain Elevators Bulk Handling

Facilities," is not "acceptable proof" of industry recognition of a hazard.

II

The first question to be resolved with respect to item 3(b), "failure to provide explosion relief venting in grain transport legs," is whether the judge erred in ruling that the Secretary had failed to establish a recognized hazard. Recognition of the hazard, either by the employer or the employer's industry, is an element of the Secretary's prima facie case in proving a violation of the general duty clause. See Continental Oil Co. v. OSHRC, 630 F.2d 446 (6th Cir. 1980), cert. denied, 101 S.Ct. 1481 (1981); Beaird-Poulan, A Division of Emerson Electric Co., 79 OSAHRC 21/D11, 7 BNA OSHC 1225, 1979 CCH OSHD ¶ 23,493 (No. 12600, 1979); Empire Detroit Steel Division, Detroit Steel Corp. v. OSHRC, 579 F.2d 378 (6th Cir. 1978).

Judge Wienman defined the hazard in item 3(b) as the "absence of explosion relief venting." Based on that characterization of the hazard, he concluded that the record lacked sufficient evidence to show recognition of the hazard. However, we have held that a recognized hazard is not to be defined in terms of the absence of appropriate abatement measures. Beaird-Poulan, A Division of Emerson Electric Co., supra. The hazard identified by item 3(b) is the hazard of secondary grain dust explosions and fires in confined spaces such as elevator legs.

The record is replete with evidence both of Cargill's and of the grain handling industry's recognition of this hazard. To single out but some of this evidence, we take especial note that Cargill's own assistant manager testified that he is a member of the Static Metal Sparking Committee of the Explosion Research Council of the National Grain and

Feed Association and that one of the Committee's objectives is "to discover more about how a leg must be vented or how it can be vented safely." He described a number of experiments then being conducted regarding explosion relief for elevator legs and said he agreed with the Secretary's expert witness that the leg is the most hazardous area in a grain elevator and that adequate venting would substantially reduce the severity of grain dust explosions. In addition, the Secretary introduced into evidence a Literature Survey of Dust Explosions in Grain Handling Facilities: Causes and Preventions prepared by the Energy and Mineral Resources Researth Institute of Iowa State University. This survey states, in pertinent part,

> Usually the initial explosion is followed in close succession by one or more secondary explosions of much greater magnitude. The secondary explosions are presumably caused by suspension of dust, which has accumulated in other areas of the plant, by the initial or subsequent shock waves. . . . [T]here are areas during operation of a typical grain elevator where the formation of critical dust concentrations is almost inevitable. This is particularly true of the elevator legs which contain the bucket elevators which carry the grain to the head house at the top of the bins or silos.

The Secretary also entered into evidence a publication of the Farmland Insurance Company, which contains an article, "Explosion Vent Prevents Major Loss," describing an elevator leg grain dust explosion in which damage was minimized by an explosion relief vent.[2/] Accordingly,

---

2/ It is to be noted that although much of this evidence focuses on the feasibility of explosion relief venting, as well as on the capacity of grain dust to burn and explode, it was received into evidence and is being considered here for the limited purpose of determining recognition of the hazard, and not for the purpose of determining feasibility of abatement.

we conclude that the Secretary has established both industry and employer recognition of the hazard.

The second question to be resolved with respect to item 3(b) is whether the Secretary established feasibility of abatement. "A violation of the general duty clause cannot be sustained unless the Secretary is able (1) to establish the type of employer conduct necessary to avoid citation under similar circumstances and (b) to demonstrate the feasibility and likely utility of such conduct." Williams Enterprises, Inc., 79 OSAHRC 24/A2, 4 BNA OSHC 1663, 1666, 1976-77 CCH OSHD ¶ 21,071 at 25,361 (No. 4533, 1976); see also National Realty and Construction Co. v. OSHRC, 489 F.2d 1257 (D.C. Cir. 1973); Bomac Drilling, Division of TRG Drilling Corp., 81 OSAHRC 45/A2, 9 BNA OSHC 1681, 1981 CCH OSHD ¶ 25,363 (No. 76-450, 1981).

The Secretary suggested, through expert testimony, that Cargill abate the hazard by extending the sheet metal leg casings directly up through the grain elevator and feed mill roofs. The resultant roof-top vents should, according to the Secretary's expert, substantially reduce, if not eliminate, the number and intensity of secondary grain dust explosions in the event of an initial conflagration or deflagration.[3/]

In rebuttal, Cargill presented the uncontradicted testimony of its plant superintendent that it would be physically impossible to extend

---

3/ The Commission has held that "[i]t is sufficient if [a] method [of abatement] materially reduces, even though it may not eliminate, the hazard." Whirlpool Corp., 79 OSAHRC 32/A14, 7 BNA OSHC 1356, 1360, 1979 CCH OSHD ¶ 23,552 at 28,535 (No. 9224, 1979); see also Royal Logging Co., 79 OSAHRC 84/A2, 7 BNA OSHC 1744, 1979 CCH OSHD ¶ 23,914 (No. 15169, 1979), aff'd, 645 F.2d 822 (9th Cir. 1981); Titanium Metals Corp. of America v. Usery, 579 F.2d 536 (9th Cir. 1978); National Realty, supra.

the leg casings through the two roofs without piercing structural beams which support the roofs. He stated that to sever these structural members would weaken the roofs.

We have stated that once the Secretary has specified a method of abatement which would reduce or eliminate the incidence of the hazard, the employer may rebut the feasibility of that method with evidence "showing or tending to show that use of the method or methods established by Complainant will cause consequences so adverse as to render their use infeasible." Royal Logging Co., supra note 3, 7 BNA OSHC at 1751, 1979 CCH OSHD at p. 28,997. Cargill's plant superintendent testified that to extend the leg casings in the manner suggested by the Secretary would seriously weaken the roofs in question because the casings would have to pierce overhead supporting structures. This testimony was neither challenged nor rebutted by the Secretary, and there is nothing in this record to cast his testimony into doubt.

The Secretary contends on review that this rebuttal testimony does not disprove the feasibility of the recommended abatement because Cargill did not show that the extensions could not be constructed so as to avoid the overhead beams. However, it was the Secretary who specified in the first instance a form of abatement that would require cutting holes in the roof directly over the legs and in the same size and shape as the cross sections of the legs. For the Secretary to suggest now that extensions could have been installed in some way other than that proposed by the Secretary's expert at the hearing raises questions of fact for the first time on review. It is axiomatic that a reviewing tribunal should not decide a case on evidence not in the record, particularly

where, as here the "facts" are by no means certain. See National Realty, supra; 4 AM. JUR. Appeal & Error § 491 (1962).

The Secretary also points out that the judge made no finding of fact with respect to the question of whether direct vertical extensions would, indeed, weaken the roofs. However, it is the Commission, not the administrative law judge, who is the ultimate trier of fact. Accu-Namics, Inc. v. OSHRC, 515 F.2d 828, 834 (5th Cir. 1975), cert. denied, 425 U.S. 903 (1976). We conclude, in the face of the Secretary's failure to offer any evidence to the contrary, that Cargill has proved that incisions into overhead supporting beams would seriously weaken if not cause the collapse of the roofs involved.

Accordingly, we affirm the judge's vacation of item 3(b) on the ground that Cargill proved infeasibility of the proposed means of abatement.

III

Whereas item 3(b) was directed at the hazards of fire and explosion which follow upon an initial deflagration or conflagration of grain dust in elevator legs, item 3(c), the tramp metal charge, was directed at the capacity of ferrous metal to provide the initial ignition source due to friction sparking. It was the Secretary's contention that tramp metal could act as the ignition source for fire and explosion by releasing friction sparks in its progress through the metallic grain handling equipment.

Judge Wienman vacated that item on the ground that the record lacked sufficent proof of recognition of the hazard or the utility of the means of abatement. However, Judge Wienman never actually defined

the "recognized hazard" at issue under the tramp metal charge. In consequence it is not clear whether his references both to "recognized hazard" and to "utility of abatement" are to be taken as alternative grounds for vacation, or whether they reflect the judge's view of the hazard as lack of the recommended means of abatement, namely magnets and grating of the type described in the citation.

The hazard with which item 3(c) is concerned is the initial grain dust fire or explosion caused by tramp metal sparking. The judge's decision does not contain a finding as to whether the record shows, by a preponderance of the evidence, that either the grain handling industry or Cargill recognizes such a hazard. Accordingly, we remand the case on item 3(c) to the judge for an assessment of the evidence regarding this element of a general duty clause violation. In the event the judge determines that industry recognition of the hazard has been shown, then a determination as to the remaining elements of a general duty clause violation must be made.

IV

Judge Wienman ruled that NFPA 61B, "Grain Elevators Bulk Handling Facilites," is not "acceptable proof" of industry recognition of a hazard. NFPA 61B is a voluntary industry standard which has never been adopted as an OSHA standard and hence has neither the force nor effect of law. Judge Wienman concluded that this standard could not be used to establish industry recognition of a hazard because it applies only to facilities erected in 1973 or later and which are undergoing major replacement or alteration. Cargill's grain elevator and feed mill were constructed prior to 1973 and were not undergoing major renovation or replacement.

It is well established that voluntary industry standards are admissible and probative evidence of industry recognition of hazards. Bethlehem Steel Corp. v. OSHRC, 607 F.2d 871 (3d Cir. 1979); H-30, Inc. v. Marshall, 597 F.2d 234 (10th Cir. 1979); Titanium Metals Corp. of America v. Usery, supra note 3; Beaird-Poulan, A Division of Emerson Electric Co., supra; The Boeing Co., Wichita Division, 77 OSAHRC 188/D13, 5 BNA OSHC 2014, 1977-78 CCH OSHD ¶ 22,266 (No. 12879, 1977); cf. Betten Processing Corp., 75 OSAHRC 43/E2, 2 BNA OSHC 1724, 1974-75 CCH OSHD ¶ 19,481 (No. 2648, 1975) (ANSI standard used to show industry recognition of the hazard had been incorporated by reference into OSHA construction standards but had not been adopted in the general industry standards applicable to the Respondent's industry). The fact that this particular voluntary standard applies to facilities erected in 1973 or later and undergoing major replacement or renovation has no bearing on its relevance to industry awareness of certain hazards associated with grain dust and grain handling equipment. Accordingly, Judge Wienman's ruling that it is unacceptable proof of recognition is error.

Judge Wienman's vacation of item 3(b) is affirmed, for the reasons stated above. His vacation of item 3(c) is reversed and that item is remanded for disposition consistent with this opinion. SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

RAY H. DARLING, JR.
EXECUTIVE SECRETARY

DATED: FEB 26 1982

ROWLAND, Chairman, concurring in part and dissenting in part:

I concur with the majority's disposition of citation item 3(b), but I do not join in the majority's broad statement that a "hazard is not to be defined in terms of the absence of appropriate abatement measures." Concerning item 3(c), I dissent from the majority's decision to reverse the judge and remand the case. I would affirm the judge's decision to vacate citation item 3(c) on the grounds that the Secretary did not show recognition of the hazard or utility of the recommended means of abatement.

The majority correctly concludes with regard to item 3(b) that the Secretary established a recognized hazard of secondary grain dust explosions and fires in the confined spaces of the elevator legs at Cargill's facility. Insofar as the judge held to the contrary, he erred, but the error was harmless since, as the majority states, the judge correctly vacated the citation for failure of the Secretary to show a feasible method of abatement. In my view, it is sufficient to note that the judge committed harmless error, without reaching the issue of whether a hazard may be defined in terms of the absence of appropriate abatement.

As to item 3(c), Judge Wienman correctly described the hazard throughout his decision as "fires or explosions . . . attributed to tramp metal" and "tramp metal caus[ing] sparking and . . . an ignition source." The judge's description of the hazard is supported by the record and is indeed indistinguishable from the majority's own definition of the hazard. 4/

Consistent with the cases cited in the lead opinion, voluntary industry standards, such as NFPA 61B, are indicative of industry recognition of hazards

---

4/ The majority defines the hazard as "the initial grain dust fire or explosion caused by tramp metal sparking."

but do not conclusively prove recognition absent other credible and probative evidence. See, e.g., Bethlehem Steel Corp. v. OSHRC, 607 F.2d 871 (3d Cir. 1979) (recognition shown by evidence of voluntary private standard, admission that voluntary standard represented industry consensus, and evidence that standard generally followed in industry). Although the judge erred to the extent that he suggested that voluntary industry standards should never be accorded any weight, his error was harmless. In addition to stating that NFPA 61B was not "acceptable proof" of recognition, Judge Wienman examined the evidence - independent of that relating to NFPA 61B - and concluded that the record was insufficient to show that the hazard was recognized. The judge's conclusion reflects his implicit credibility evaluation of the testimony and usually should not be disturbed on review. Kus-Tum Builders, Inc., 81 OSAHRC 97/B2, 10 BNA OSHC 1128, 1981 CCH OSHD ¶ 25,738 (No. 76-2644, 1981). Accepting the judge's credibility determination, I conclude that the judge correctly held that the Secretary failed to show the hazard was recognized. 5/ Accordingly, I would affirm the judge's vacation of item 3(c).

Moreover, I would not disturb the judge's conclusion that the Secretary did not establish the utility of the proposed abatement measures. Neither party disputes on review the judge's determination that the magnets and screens, the recommended means of abatement, would not be useful. Since the propriety of the judge's determination regarding utility of abatement was not contested by the Secretary in his review petition nor directed for review by the Commission, the judge's conclusions on this issue are final. See Commission Rule 92(c), 29 C.F.R. § 2200.92(c). Since a violation of section 5(a)(1) cannot be

---

5/ The record does not establish that Cargill, as distinguished from the industry, recognized the hazard.

found unless the Secretary establishes the feasibility and utility of the recommended abatement, I dissent from the majority's decision to remand the case for further disposition.

|---|---|
| SECRETARY OF LABOR,<br><br>Complainant<br><br>v.<br><br>CARGILL, INC.,<br>NUTRENA FEED DIVISION,<br><br>Respondent | DECISION & ORDER<br>OSHRC DOCKET 78-5707 |

APPEARANCES: EUGENE F. DESHAZO, Esq., U.S. Department of Labor, Office of the Solicitor, Kansas City, Missouri, for the Complainant

ROBERT L. HOBBINS, Esq., Dorsey, Windhorst, Hannaford, Whitney & Halladay, Minneapolis, Minnesota, for the Respondent

Wienman, Judge, OSHRC:

## STATEMENT OF THE CASE

This is a proceeding wherein Respondent contests a Citation which charged multiple violations of the Occupational Safety and Health Act of 1970 (29 U.S.C. 651 et seq.) at a feed mill in McPherson, Kansas. The Citation alleged serious violations of specific OSHA regulations and Section 5(a)(1) of the Act, the so-called General Duty Clause. Penalties totalling $4,320 were proposed for the alleged violations. Respondent timely contested all items and penalties except item 4 for which a $630 penalty was

proposed. The cause was assigned to the undersigned Judge by an order of the Commission dated March 6, 1979, and a hearing was held in Wichita, Kansas, on June 28, 1979.

## THE ISSUES

No jurisdictional matters remain in issue. The parties pleaded facts sufficient to establish that Respondent is subject to the Act and that the Commission has jurisdiction of the parties and the subject matter.

Prior to the hearing the parties entered into an agreement terminating the contest with respect to all but two items. Remaining in dispute are items 3(b) and 3(c).

Item 3(b) alleged a violation of Section 5(a)(1), the General Duty Clause,[1/] as follows:

> The two pellet mill legs, the jack leg, the east and west elevator legs are not provided with explosion reliefs vents to the outside atmosphere exposing employee(s) to the hazards of fire and/ or explosion.

Item 3(c) alleged a violation of the General Duty Clause because three grain receiving pits were not provided with "permanent magnets, approved electromagnets, or specific gravity separators or screens of sufficient size to prevent entry of tramp metal into the

---

1/ Section 5. (a) Each employer--

> (1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees;

system."

The chief issues for decision are whether Respondent violated the Act as alleged. Ancillary issues relate to the mode and extent of the Secretary's use of the General Duty Clause in connection with items 3(b) and 3(c).

## SUMMARY OF THE EVIDENCE AND DISCUSSION

### Item 3(b): Explosion Relief Vents

Raymond R. Rogers, the OSHA Compliance Officer who inspected the facility in September 1978, provided a physical description of the workplace. Additional detail was supplied by Thomas Smolen, Plant Superintendent. The record contains no significant dispute as to the physical facts which are summarized from the testimony of Rogers and Smolen.

The cited facility is a feed mill plant which receives grain (corn and milo) and certain other commodities and processes them into animal feed products. The facility consists of a reinforced concrete elevator, where grain and commodities are received and briefly stored, and a sheet metal mill building in which the ingredients are processed. The grain elevator was built in 1959, and the feed mill erected in 1965. Cargill acquired the plant in 1967. The chief grain handling equipment consists of two 180 foot vertical conveyors or "legs" located in the elevator. The grain processing equipment includes various mills and grinders mainly located in the mill building (T. 7-8, 98-100, 118).

Complainant cited five of six conveyor legs in the elevator and

mill as presenting fire and explosion hazards for want of relief venting to the outside atmosphere. The sixth, a "mixer leg," was equipped with 6" x 6" air relief vent (T. 136) and was not cited upon Rogers' recommendation (T. 12-13). During the hearing the Secretary elected to withdraw the allegations as to two pellet legs, conceding they were unlikely to contain an explosive concentration of dust (T. 132).

Bruce Carl Beelman, an OSHA supervisory safety specialist who currently serves on a National Academy of Science Committee studying grain elevator explosion and fires (T. 46), explained the theory and function of explosion relief venting. In the event of an initial explosion, relief vents serve to prevent propagation to other portions of the workplace (T. 57). This is particularly important because initial explosions in grain elevators do not cause the majority of the damage. Subsequent explosions increase in intensity as more dust is lifted and placed in suspension (T. 58). Beelman also testified that the highest dust concentrations were generally found within the elevator legs and that the leg was "the number one source" of elevator explosions whose causes were known (T. 60).

Beelman disclaimed any qualifications as an expert able to calculate the venting area necessary to provide explosion relief for a given structure (T. 79), but nevertheless asserted that relief venting of the cited legs could be accomplished by extending simple ducts directly through the roof above the legs (T. 84).

Respondent took sharp issue with Beelman's testimony relative

to feasibility. Under cross-examination Beelman was unable to name an authoritative source setting forth guidelines for venting an elevator leg (T. 81). He further conceded that NFPA No. 68, a source document he relied on, consisted entirely of "recommended practices" as opposed to industry "requirements" (T. 81). The National Academy of Science Committee he served on was considering recommending that elevator legs be provided with vents equal to the cross section of the leg, but no final recommendation had been made (T. 79).

As to industry practices, Beelman testified 60 to 70 percent of the facilities OSHA inspects have "some type of venting system" (T. 88), but the vents are not as large as cross-sectional areas of the legs (T. 89). What percentage of the inspected elevators are equipped with vents designed to relieve explosive pressures as opposed to simple breather pipes which merely prevent creation of vacuums inside the legs was not clear from Beelman's testimony.

John A. Johnston, assistant manager of Cargill's grain research laboratory, testified that he served as chairman of the Static and Metal Sparking Committee of the Explosion Research Council of the National Grain and Feed Association (T. 152). He regularly reviews technical information concerning grain elevator safety, and testified that Cargill was involved in a project to conduct venting and explosion suppression tests on elevator legs with the Explosion Research Council (T. 167).

Johnson testified that the formula for determining explosion

relief is most commonly expressed as a ratio of vent area to the cubic volume of the vessel but that a number of variables affected the formula: the shape of the vessel, the nature of the material, type of dust, temperature, pressure, etc. Also, unusually shaped containers, especially long, narrow ones, pose special problems, and no expert to date has established a formula for explosion venting relief of elevator legs (T. 160-161).

A review of the testimony reveals a number of shortcomings in Complainant's effort to establish a violation as alleged in item 3(b). However desirable it may be to provide elevator legs with explosion relief venting, the proof does not indicate (1) that this is a generally recognized practice within the industry and (2) that explosion relief venting of the cited legs was feasible by the means suggested by the OSHA representatives. The elements of proof in a General Duty Clause violation case were stated by Judge J. Skelly Wright in National Realty and Contruction Co., Inc., v. OSHRC and Secretary of Labor, 489 F.2d 1257 (D.C. Cir., 1973). Not only must the Secretary prove that the employer failed to render its workplace free of a recognized hazard causing or likely to cause death or serious physical harm, but "the Secretary must be constrained to specify the particular steps a cited employer should have taken to avoid citation, and to demonstrate the feasibility and likely utility of those measures." 489 F.2d 1257, 1268

Because the secretary failed to meet this burden, item 3(b) must be vacated.

Item 3(c): Tramp Metal

Acting upon an OSHA instruction that a General Duty Clause violation may be recommended on the basis of provisions found in NFPA No. 61B-1973,[2/] Compliance Officer Rogers cited Respondent for lack of adequate screens, magnets, or other devices to prevent entry of tramp metal into the system at the grain receiving pits. Rogers observed that Respondent's receiving pits were protected only by wide grates with openings approximating 2 1/2" x 12" (T. 10). Rogers, who had inspected approximately four similar facilities before September 1978, testified that the grates were typical of those that he had observed at other elevators (T. 24), but he nevertheless recommended the Citation. The hazard, he warned, was that tramp metal causes sparking and could prove an ignition source. He could identify no grain elevator explosion which had been reliably attributed to tramp metal (T. 15). He also admitted that prior to September 1978 he had never seen a magnetic separation device in use (T. 24).

Mr. Beelman came closer to attributing a grain elevator explosion to tramp metal, stating that OSHA investigators had concluded that tramp metal was the most likely cause of an elevator explosion which had occurred in Garvey, Kansas (T. 49-52).

As to feasible abatement means, Beelman testified that a number

---

2/ A standard for the prevention of fire and dust explosions in grain elevators and bulk grain handling facilities adopted by the National Fire Protection Association at its 1973 annual meeting.

of studies had determined that grates with 1 1/2" openings did not affect production flow (T. 71). On cross-examination Beelman admitted that out of 1500 elevators in Kansas, he knew of only 5 which were equipped with 1 1/2" square mesh grates, and only about 20 to 25 percent had magnetic protection in their receiving pits (T. 72).

John Johnson, Respondent's chief rebuttal witness, countered by stating that all reliable studies indicated that metal sparks alone were not of sufficient energy to cause an explosion. He did concede that the friction of rubbing metal might initiate an explosion or fire (T. 153). Johnson contended that there was no reliable basis for asserting that tramp metal was a hazard in grain handling equipment and that no existing industry practice required special devices above and beyond the type of grating in place at the McPherson elevator (T. 154). He stated that he knew of no fires or explosions reliably attributed to tramp metal and that the combination of the grates and auger at the McPherson plant prevented the entry of any metal large enough to cause a fire or explosion by friction (T. 156).

There are a number of deficiencies in the Secretary's case, chief of which is the reliance upon NFPA No. 61B-1973 as the basis for allegations of a General Duty Clause violation. The Forward to NFPA No. 61B expressly states that the standard applies only to facilities erected subsequent to the date of the standard and is an advisory guide for owners or operators engaged in major replacement or renovation of existing facilities. Since both the elevator and

mill structures were erected in the 1960's, NFPA No. 61B-1973 has advisory application only to the McPherson facility. We have labored the point in other decisions, but it is suffice to repeat our conviction that advisory provisions of a private industry standard are not acceptable proof of industry recognition of a hazard. The Secretary seeks to impose new and disputed technology upon the industry as a means of reducing the incidence of grain elevator explosions. Time may prove the Secretary correct, but the record contains insufficient independent proof of a recognized hazard or the utility of the recommended technology to support the Citation. Item 3(c) must be vacated.

## FINDINGS OF FACT

1. A preponderance of the reliable, probative, and substantial evidence supports the findings of fact set forth in the Summary of Evidence and Discussion.

2. The parties entered into an agreement settling all but two disputed issues prior to trial. The terms of the agreement are set forth on transcript pages 4-6. No reason appears why the agreements contained therein should not be approved by the Commission.

## CONCLUSIONS OF LAW

1. At all material times Respondent was an employer within the meaning of Section 3 of the Occupational Safety and Health Act of 1970.

2. Jurisdiction of this proceedings is conferred upon the Occupational Safety and Health Review Commission by Section 10(c) of

the Act.

3. The mutual agreements set forth on pages 4-6 of the transcript are consistent with the purpose of the Act. In all instances where the Secretary has agreed to modify a Citation item or penalty proposal, and in all instances where the Respondent has agreed to withdraw its Notice of Contest to a Citation item, the parties are bound by their respective agreements. All Citation items thus settled by mutual agreement are amended to conform with the express terms of the agreement.

4. With respect to the remaining disputed items, namely, items 3(b) and 3(c), the evidence fails to establish the existence of violations of Section 5(a)(1) of the Occupational Safety and Health Act of 1970.

## ORDER

Based on the above Findings of Fact and Conclusions of Law, it is ORDERED that:

1. Citation items subject to settlement by stipulation of the parties are modified, vacated, or affirmed according to the agreed terms, namely:

(a) Items 1 and 6 of Citation Number 1 issued to Respondent October 26, 1978, are vacated.

(b) Item 3(a) of said Citation is affirmed and a penalty in the sum of $100 assessed thereon.

(c) Item 5 of said Citation is affirmed and a penalty of $540 assessed thereon.

(d) Item 7 of said Citation is modified to allege a nonserious violation of Section 110-17(a) of the National Electrical Code, NFPA 70-1971, as adopted by 29 CFR 1910.309(a). Item 7, as modified, is affirmed without monetary penalty.

(e) Item 8 of said Citation is affirmed and a penalty in the sum of $500 assessed thereon.

2. The disputed serious violations, namely, items 3(b) and 3(c) of Citation Number 1 issued October 26, 1978, are vacated.

Date: November 8, 1979

| SECRETARY OF LABOR, | : | |
| Complainant, | : | |
| v. | : | OSHRC Docket No. 78-5956 |
| CORNELL & COMPANY, INC., | : | |
| Respondent. | : | |
| | : | |

DECISION

Before, ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

A decision of Administrative Law Judge Seymour Fier is before the Commission pursuant to section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). Judge Fier affirmed a citation alleging that Cornell & Company, Inc., violated section 5(a)(1)[1/] of the Act because "[e]mployees were allowed to work under a beam suspended above [their] heads . . . [while] installing [a] lower beam suspended from [the] same hook. . . ."

In response to Cornell's petition for discretionary review, former Commissioner Barnako directed review on the following issues:

> (1) Whether the judge erred in concluding that the provisions of the New Jersey Administrative Code, specifically subchapter 20.16.5(5) of the Construction Safety Code, establish recognition of a hazard within the meaning of 29 U.S.C. § 654(a)(1).

---

1/ Section 5(a)(1), 29 U.S.C. § 654(a)(1), provides that "[e]ach employer . . . shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees."

> (2) Whether a violation of 29 U.S.C. § 654(a)(1) can be found in view of the provisions of 29 C.F.R. § 1926.550(b)(2).
>
> The parties are also requested to address the following question:
>
> Whether the provisions of ANSI standard B-30.5 noted in Respondent's Memorandum in Support of Petition for Review are not mandatory and, if those provisions do not impose mandatory requirements, whether such fact constitutes a determination by the Secretary of Labor that the work practices in issue are not hazardous, so that a citation alleging violation of 29 U.S.C. § 654(a)(1) is improper.

Because we conclude that 29 C.F.R. § 1926.550(b)(2) applies to the hazard cited by the Secretary of Labor, we vacate the citation under section 5(a)(1).[2/]

Section 1926.550(b)(2) provides that "[a]ll crawler, truck, or locomotive cranes in use shall meet the applicable requirements for design, inspection, construction, testing, maintenance and operation as prescribed in the ANSI B30.5-1968, Safety Code for Crawler, Locomotive and Truck Cranes." Section 5-3.2.4(b) of ANSI B30.5-1968 provides that "[n]o person should be permitted to stand or pass under a load on a hook." It appears that a truck crane was being used in this case.[3/] Also, because

---

2/ Because we conclude that the citation to § 5(a)(1) was inappropriate, we do not reach the first directed issue, concerning the Secretary's proof of a recognized hazard under section 5(a)(1).

3/ Respondent's vice president testified that the facts in this case were similar to those in an earlier case in which Respondent was cited for violating section 5(a)(1). The citation, which Respondent placed in evidence (Exh. R-3), alleged that a truck crane was being used. Also, the judge's decision, which Respondent placed in evidence (Exh. R-1), indicates that the Secretary's evidence in that case was that Respondent was using a truck crane. The citation was vacated because the Secretary failed to establish a recognized hazard. When this evidence was presented at the hearing in this case, Respondent had already raised the possibility that a standard, § 1926.550(b)(2), applies. However, the Secretary offered no rebuttal to

(continued on next page)

the Secretary's concern was that Cornell's employees who were installing the lower of two beams suspended from the same hook were standing under the upper beam, the hazard brought under section 5(a)(1) is the same one covered by section 1926.550(b)(2) and ANSI section 5-3.2.4(b). Accordingly, there is a standard which applies to the hazard cited under section 5(a)(1) in this case.

Citation to section 5(a)(1) is inappropriate where a standard applies to the hazard in the case. Mississippi Power & Light Co., 79 OSAHRC 109/D12, 7 BNA OSHC 2036, 1980 CCH OSHD ¶ 24,146 (No. 76-2044, 1979), citing Brisk Waterproofing Co., 73 OSAHRC 30/E1, 1 BNA OSHC 1263, 1973-74 CCH OSHD ¶ 16,345 (No. 1046, 1973). Because ANSI section 5-3.2.4(b) applies to the hazard in this case, the standard incorporating this ANSI provision, section 1926.550(b)(2), preempts section 5(a)(1). See A. Prokosch & Sons Sheet Metal, Inc., 80 OSAHRC 96/A2, 8 BNA OSHC 2077, 1980 CCH OSHD ¶ 24,840 (No. 76-406, 1980). Accordingly, citation to section 5(a)(1) in this case was inappropriate and the citation must be vacated. SO ORDERED.

FOR THE COMMISSION

Ray H. Darling Jr.

RAY H. DARLING, JR.
EXECUTIVE SECRETARY

DATED: FEB 26 1982

---

3/ (continued)

the vice president's testimony and Respondent's exhibits. Moreover, the Secretary does not contend that the crane was not a type covered by § 1926.550(b)(2). Therefore, on the basis of Respondent's evidence, we find that the crane used in this case was a truck crane.

COTTINE, Commisioner, dissenting:

The majority decision is dependent on one critical fact - the type of crane used by Cornell at this worksite. Unless the crane is a crawler, locomotive or truck crane, 29 C.F.R. §1926.550(b)(2) does not apply.[1/] There is no evidence in the record that Cornell's crane is a truck crane, or a crawler or locomotive crane. My colleagues essentially acknowledge that there is no probative evidence on this point because they state, "It appears that a truck crane was being used in this case." Slip op. at 2 (emphasis added). Factual issues, however, must be decided on the basis of record evidence.

The majority's inference in this case is predicated on a prior citation issued to the Respondent for a section 5(a)(1) violation at a different construction worksite involving a truck crane. Based on the testimony of the Respondent's vice president that these cases are "similar", the majority concludes that the crane used at this worksite must be a truck crane because a truck crane was used at the other worksite. Reasonable inferences may be drawn from circumstantial evidence, i.e., "circumstances having been found by experience so associated with that fact that in the relation of cause and effect they lead to a satisfactory conclusion." 1 JONES ON EVIDENCE §1.3 at 4 (6th ed. 1972). However, in the absence of additional evidence linking the characteristics of the

---

1/ §1926.550 Cranes and derricks.

* * *

(b) Crawler, locomotive, and truck cranes .

* * *

(2) All crawler, truck, or locomotive cranes in use shall meet the applicable requirements for design, inspection, construction, testing, maintenance and operation as prescribed in the ANSI B30.5-1968, Safety Code for Crawler, Locomotive and Truck Cranes.

cranes or the conditions of use together, the inference in this case bears no relation to fact or experience.[2/] There is no reasonable association between the type of crane used at one construction site and those used at another site without additional evidence. An illustrative example of circumstantial evidence is given in JONES ON EVIDENCE:

> [W]hen footprints are discovered subsequent to a recent snow, it is proper to infer that some animated being passed over the snow after it fell; and from the form and number of the footprints it can be determined whether they are those of a man, a bird or a quadruped.

Id. Regrettably, the crane in this case left no tracks in the snow or imprint on the record. The only "satisfactory conclusion" sought by the majority in this case is a factual basis to apply the Commission's precedent in A. Prokosch & Sons Sheet Metal, Inc., 80 OSAHRC 96/A2, 8 BNA OSHC 2077, 1980 CCH OSHD ¶24,840 (No. 76-406, 1980). Unfortunately, there is no evidentiary basis for my colleagues' conclusion that "there is a standard which applies to the hazard cited under section 5(a)(1) in this case."

The majority's legal conclusion is also untenable. The majority concludes that the Secretary will not be permitted to prove an allegation that Cornell exposed its employees to serious, recognized hazards prohibited by section 5(a)(1) of the Act, 29 U.S.C. §654(a)(1), because a specific standard covers the working conditions involved here. However, no such standard applies. An occupational safety and health standard is expressly defined under the Act as "a standard which requires conditions . . . reasonably necessary or appropriate to provide safe or healthful employment and places of employment." Section 3(8) of the Act, 29 U.S.C. §652(8). All that §1926.550(b)(2) does is to incorporate by reference certain

---

2/ Moreover, the absence of any rebuttal by the Secretary to the Respondent's evidence regarding the previous citation does not affirmatively establish or support any inference concerning the identity of the crane.

applicable requirements in ANSI B30.5-1968. See note 1 supra. The ANSI provision said to be applicable by the majority, section 5-3.2.4(b), is not a requirement.[2/] It is merely advisory.[3/] Therefore it is not an applicable standard nor a requirement incorporated by reference in the OSHA standard. It does not preclude the Secretary from citing the alleged hazards under section 5(a)(1) of the Act. See A. Prokosch & Sons Sheet Metal, Inc., supra, 8 BNA OSHC at 2082, 1980 CCH OSHD ¶24,840, p. 30,630 (No. 76-406, 1980) (Cottine, Commissioner, dissenting).

---

2/ Section 5-3.2.4(b) provides: "No person should be permitted to stand or pass under a load on the hook."

3/ ANSI B30.5-1968, Introduction, Section V, states:

> Mandatory rules of this Code are characterized by the use of the word "shall." If a rule is of an advisory nature it is indicated by the use of the word "should" or is stated as a recommendation.

## DECISION AND ORDER

FIER, JUDGE:

## PRELIMINARY STATEMENT

This is a proceeding pursuant to section 659 of the Occupational Safety and Health Act of 1970 (29 U.S.C. section 651 et seq., hereinafter called the Act), wherein Respondent contests the citation and penalty for one serious violation and one nonserious violation. The citations were dated

November 21, 1978 and were issued with the proposed penalty pursuant to sections 9(a) and 10(a) of the Act. The citations were based on an inspection conducted November 15, 1978.

Pursuant to section 10(c) of the Act, 29 U.S.C. section 659(c), Respondent, through a letter dated December 8, 1978, noted its timely contest to the citations and proposed penalty.

The standards which were violated are set forth as 29 U.S.C. 654 section 5(a)(1) with a proposed penalty totaling $720.00 and 29 CFR § 1926.450(a)(1) with no penalty proposed.

## I S S U E S

The following issues are pertinent to the disposition of this case:

1. Did the Respondent fail to provide a place of employment that was free from recognized hazards which were likely to cause death or serious physical harm to employees?

2. Did Respondent violate section 29 CFR 1926.450(a)(1)?

3. If the Respondent is found to have violated any or all of the above, what penalty or penalties, if any, should be assessed for any of the violations of the Act.

## STATEMENT OF THE EVIDENCE

The Respondent, Cornell & Company, Inc. (hereafter referred to as Cornell), by stipulation admits that it is

licensed to do business as a corporation in the State of New Jersey (Tr. 3).* The company is engaged in a business affecting commerce since the company uses equipment manufactured outside of the state and does work in other states (Tr. 3). There are approximately 150 employees of the Respondent (Tr. 3). The Respondent also acknowledges that it has a prior history before the Occupational Safety and Health Administration (Tr. 3).

On November 15, 1978, Harry Clugston, the Compliance Officer (hereafter referred to as C.O.), inspected Respondent's worksite (Tr. 4, 6). This was a multi-employer site in which Robert McDonald of Cornell was in charge at the time (Tr. 6). Respondent was erecting a steel frame on an existing building in Atlantic City, New Jersey (Tr. 7).

The C.O. issued a citation for a violation of section 5(a)(1) of the Occupational Safety and Health Act when he observed Cornell's employees transporting structural steel beams with a crane, in a tandem or "Christmas tree" fashion, to the third floor level (Tr. 7-8, 17). The C.O. testified that these steel beams swung over the heads of the workers in a dangerous manner specifically prohibited by the New Jersey State Safety Code since 1963. At the time of the violation, the steel was about 100 feet up with the beams separated about 7 to 8 feet above the employees' heads (Tr. 24). The length of a beam was about 16 feet and the weight was approximately 1,000 pounds or more (Tr 25-26). He further

---

*Denotes transcript page.

commented that the "Christmas tree" practice, as it is known in the trade, has almost disappeared due to past State enforcement of the statute (Tr. 8). The enforcement of the New Jersey statute has been "turned over" to Federal jurisdiction (Tr. 9-10).

The C.O. testified that it was a routine practice on the the jobsite for two beams, one over one, to be installed simultaneously (Tr. 8). It was the C.O.'s opinion that the upper beam could be moved or tilted by a gust of wind, by mechanical failure of the crane, or some other difficulty possibly striking and killing an employee or employees (Tr. 9). The C.O. indicated that the Respondent should have picked up the beams one at a time or set the top beam first and then the bottom beam, so that the employees would not be endangered. According to testimony, Mr. McDonald's only comment to the C.O.'s suggestion at the time was that he had not thought of it.

The Respondent introduced into evidence a copy of a decision by Judge Henry McQuade dated March 30, 1979, Secretary v. Cornell and Co., CCH OSHD ¶ 23,577, (Docket No. 78-2723, 1979) dealing with identical issues and parties as in the instant case. The only purported difference between Judge McQuade's case and the instant case was one of location, with the former's site of violation being in Philadelphia, Pennsylvania (Tr. 14-15). The C.O. stated that had he observed the same

condition in Philadelphia, he would have issued a citation for the violation (Tr. 16). Other companies were cited for this violation in other areas, although to his personal knowledge, no worker had been hurt by the use of this practice (Tr. 18).

Since there was no specific standard covering this practice, the Respondent was cited under section 5(a)(1), relying on the New Jersey Code (Tr. 20-21) as a basis for the violation. The New Jersey standard was not incorporated under section 1926 of the Act or under the subpart for steel erection (Tr. 23-24). The New Jersey Safety Code is an extant state regulation, although it is not presently being enforced (Tr. 28-29).

Mr. Jack C. Sheppard, Vice-President of Cornell, testified that tandem lifting or "Christmas Treeing" is hazardous, but by taking certain risks, Cornell is minimizing other risks by reducing the number of times the boom must pass over the structure to install the steel (Tr. 54-55). Mr Sheppard further testified that if the New Jersey standard was enforced, no buildings would be erected (Tr. 61). He also pointed out that a National Steel Erection Code exists, entitled Construction of Structural Steel Building Frames, by Bill Rapp, (Tr. 63). On page 303, part 2.27, the book states that separate choked slings must always be used when picking up two pieces of steel at the same time and mentions tandem lifting (Tr. 64-65).

The witness stated that he was familiar with the New Jersey law, but had thought it was superseded by OSHA (Tr. 71). Although he recognized that it was part of the New Jersey safety code, he believed it was not strictly enforced (Tr. 72).

As to the nonserious violation of 29 CFR 1926.450(a)(1), the C.O. testified that he observed a Cornell employee, Mr. Jerry Johnston, climbing a column 10 feet up without using a ladder (Tr. 13). This violation was deemed nonserious because any resultant injury due to a fall from so low a height would not be serious, and thus, no penalty was proposed. The C.O. admitted however, that he was not sure whether any ladders were provided but he had observed none (Tr. 38).

## O P I N I O N

The question to be determined herein, is whether in the language of section 5(a)(1) of the Act, Respondent met the requirement that he furnish to each of his employees a place of employment which was free from "recognized" hazards, thst are causing or likely to cause death or serious injury to his employees. Complainant has charged Respondent with violating section 5(a)(1) because the employer allowed steel beams to be lifted in tandem above the employees, causing an overhead hazard. To establish a violation of section 5(a)(1), the Secretary must prove: (1) that the employer failed to

render its workplace "free" of a hazard which was (2) "recognized" and (3) causing or likely to cause death or serious physical harm to its employees. National Realty and Construction Co., Inc., v. OSHRC, 489 F.2d 1257 (D.C. Cir. 1973).

Respondent states that the Secretary has not carried his burden of proof with respect to the "Christmas Treeing" practice, as tandem lifting is known in the trade. Respondent's witness stated that "Christmas Treeing" has, to his knowledge, caused no injuries to any employee at Cornell or at any other company (Tr. 55-56). The C.O.'s testimony supports this contention (Tr. 18). However, one purpose of the Act is to prevent the first accident from occurring and a history of no injuries does not in itself prove that a practice is not a "recognized" hazard. Lee Way Motor Freight, Inc. v. Secretary, 511 F.2d 864, 1 OSHC 1689 (10th Cir. 1975).

In addition, to support its contention that "Christmas Treeing" is not a "recognized" hazard, Respondent testified that there was no specific OSHA standard, nor is there any collective bargaining agreement, prohibiting this practice (Tr. 62). The fact that there is no specific OSHA standard does not automatically lead to the conclusion that there is no "recognized" hazard. That is, indeed, the reason for this citation falling within the purview of the general duty clause provision. Furthermore, the National Steel

Erection Code, by S.A.E. entitled Construction of Structural Steel Building Frames, by Bill Rapp, which Respondent entered into evidence, does not prove that tandem lifting is not a recognized hazard. Page 303, part 2.27 which describes the manner in which tandem lifting should be accomplished, does not by its inclusion in the Code, prove that tandem lifting is recognized as a safe industry practice (Tr. 64-65).

Respondent also entered into evidence a copy of a decision dated March 30, 1979, in which Judge Henry McQuade held that Cornell did not violate the general duty clause because tandem lifting was not proven to be a "recognized" steel erection industry hazard in Philadelphia (Tr. 14-15). The Secretary was allowed, in that case, to elicit testimony to the effect that although "Christmas Treeing" was done in the Philadelphia area, it was not condoned because it was hazardous. Secretary v. Cornell and Company, CCH OSHD ¶ 23,577 (Docket No. 78-2723, 1979). In Philadelphia, the Secretary did not carry its burden of proof because there was no statute, as there is in New Jersey, proscribing tandem lifting. Thus, Judge McQuade had more latitude in determining what constitutes a "recognized" industry hazard than is possible in this case where there is a state law prohibiting the practice.

In Secretary v. Mid-Hudson Automatic Sprinkler Co., Inc., Docket No. 76-0576 (Oct. 12, 1976), this forum held that,

"A statute even though it has been repealed for various reasons, may still be received as part of the total evidence to identify an industry-wide practice and existing hazard." Since, in the instant case, the statute in question has not been repealed, further weight is given to the Secretary's allegation that the instant case should be distinguished from Judge McQuade's decision.

Respondent testified that the reason Cornell used "Christmas Treeing" was to reduce the number of times the boom must pass over the structure to install the steel and thus to eliminate some of the hazard (Tr. 54-55). Although Respondent contends that double stringing might minimize the risks of hoisting steel beams, he admitted that it is still a risky practice (Tr. 58-60). He also stated that Cornell did not utilize tandem lifting as a matter of course, but only under particular circumstances (Tr. 58).

Therefore, despite Respondent's arguments to the contrary, the Secretary has established the presence of a "recognized" hazardous condition. The Respondent's own statements to the effect that double stringing can be considered a hazardous practice and that it is the type of risk that men expect to take when they work in this field, establish actual knowledge of the hazardous nature of tandem lifting on the part of Cornell (Tr. 58).

Moreover, since 1973, Courts have recognized that a number of factors can be considered in determining whether a hazard is "recognized." Lack of industry reognition of a hazard does not suffice to prove that there is no recognized hazard. It may be fair to hold an employer to a higher standard of care than industry practice recommends. Cape and Vineyard Division v. OSAHRC, 512 F.2d 1148 (1st Cir. 1975), Secretary v. Southern Railway Co., 3 OSHC 1657 (R.C. 1975).

In the instant case, the New Jersey Administrative Code, Chapter 12.180-20.16.5(5) (Tr. 10) (Court Exhibit C-1) supports the Secretary's allegation that double stringing was a recognized hazard in the State of New Jersey since the early 1960's. Although standards may vary from state to state, the fact that New Jersey promulgated a statute prohibiting this practice is sufficient to establish a violation of section 5(a)(1) for the construction site in question. Secretary v. Puget Sound Power and Light Co., 10 OSAHRC 844, 1 BNA OSHC 1046, 1971-73 CCH OSHD ¶ 15,189 (Docket No. 15, September 28, 1972); Brennan v. OSAHRC, 494 F.2d 460 (8th Cir. 1974).

The Secretary has established the presence of a "recognized" hazardous condition. The question of actual knowledge is established by the admission of Respondent's witness that he knew of the New Jersey Act and has been with Respondent's New Jersey company since 1951 (Tr. 71, 82). Secretary of Labor v. Ford Motor Co., 5 OSHRC 1765, 5 BNA OSHC 1765, 1977-78 CCH OSHD ¶ 22,106 (Docket No. 13682, 1977). The evidence therefore,

goes further than required since once a practice is proven of a "recognized" hazard in the inudstry, the Secretary need not prove actual knowledge on the part of the employer. National Realty and Construction Co. v. OSAHRC, supra.

Therefore, the Secretary has carried its burden of proof with respect to the section 5(a)(1) violation and the citation is affirmed. The criteria for assessing the penalty included reductions of the $900.00 unadjusted penalty on the basis of size and good faith. No reduction was allowed for history, since Cornell has a previous history of violations of OSHA. The adjusted penalty of $720.00 is not disproportionate to the danger involved in this hazard, and is, therefore, affirmed, according to section 17 of the Act.

The second citation is concerned with a violation of section 1926.450(a)(1). The Secretary has met its burden of establishing a prima facie case in that the worker was observed by the C.O. climbing the column without using a ladder or stairs. If ladders were provided, it is a reasonable assumption that the employee would have used them. As it stands, no ladder was observed as being available at the site, much less being used by the employees. Even if ladders were available, the Respondent had a duty to see that his employees used them as a proper means of safe access (Tr. 41-42). Since there was little danger of serious injury, the affirmance of the violation without penalty is reasonable.

## FINDINGS OF FACT

The credible evidence and the record as a whole establishes preponderant proof of the following facts:

1. Respondent, Cornell and Company, Inc., is engaged in the erection of steel. It is engaged in a business crossing state lines and uses equipment manufactured outside the state. The materials used and effects on commerce establish that it is engaged in interstate commerce.

2. The practice known as tandem lifting or "Christmas Treeing" was a recognized hazard likely to cause death or other serious injury to Respondent's employees.

3. The hazard created by the steel beams swinging over the heads of employees were within the scope of Respondent's knowledge. Tandem lifting was known to Respondent for many years to be specifically prohibited because of the hazard involved.

4. Tandem lifting is specifically prohibited by New Jersey Adminstrative Code, Chapter 12.180-20.16.5(5).

5. Respondent did not have ladders provided at the work-site for employee use.

6. An employee of Res ondent was observed climbing a pole 10 feet high in violation of 29 CFR 1926.450(a)(1).

7. The Respondent did not prevent its employee from climbing the 10-foot column.

## CONCLUSIONS OF LAW

1. The Respondent is and was at all times herein, engaged in a business affecting commerce within the meaning of section 3(5) of the Occupational Safety and Health Act of 1970.

2. The Occupational Safety and Health Review Commission has jurisdiction over the subject matter and parties to this action.

3. The Respondent violated section 5(a)(1) by failing to provide its employees with a place of employment which was free from "recognized" hazards that are causing or likely to cause serious injury or death to its employees.

4. The Respondent violated section 1926.450(a)(1) by not providing safe access to all elevations.

## O R D E R

Upon the basis of the foregoing facts and conclusions of law, and upon the the entire record, it is hereby ORDERED that:

Citation number one, item one, is affirmed. A penalty of $720.00 is assessed.

Citation number two, item one, is affirmed with no penalty.
